A. EXECUTIVE SUMMARY

1. INTRODUCTION

The Eastgate Regional Intelligent Transportation Systems (ITS) Architecture is a roadmap for the deployment and integration of ITS in the Eastgate Regional Council of Governments (Eastgate) planning area for the next fifteen years. The Eastgate planning area, defined as the region in this Architecture, geographically covers Mahoning and Trumbull counties in northeast Ohio. The Eastgate Regional ITS Architecture provides a framework for institutional agreements and technical integration of ITS implementation projects in the region. It describes the “big picture” for ITS deployment in terms of individual ITS components that will perform the functions necessary to deliver the desired needs. It supports effective and efficient deployment of transportation and ITS projects that address the transportation problems and needs in the region.

The Eastgate Regional ITS Architecture is an open and integrated ITS architecture that is compliant with the Federal Highway Administration (FHWA) Final Rule and Federal Transit Administration (FTA) Policy on ITS Architecture and Standards. The Architecture has been developed through a cooperative effort by the highway, transit, law enforcement, emergency management, commercial vehicle, and freight management agencies. It represents a shared vision of how each agency’s systems work together by sharing information and resources to enhance transportation safety, efficiency, capacity, mobility, reliability, and security.

2. PURPOSE

The purpose of the Eastgate Regional ITS Architecture is to illustrate and document the integration of regional ITS systems to allow planning and deployment to occur in an organized and coordinated process. The Architecture helps guide the planning, implementation, and integration of ITS devices deployed and managed by multiple types of agencies that provide transportation services within the region.

The Architecture helps to accomplish the following objectives for ITS deployment in the region:

- Facilitate stakeholder coordination in ITS planning, deployment and operations;
- Reflect the current state of ITS planning and deployment within a region;
- Provide high-level planning for enhancing regional transportation systems using current and future ITS technologies; and
- Conform with the Architecture Reference for Cooperative and Intelligent Transportation (ARC-IT) and FHWA Final Rule 940 and FTA Final Policy on ITS Architecture and Standards.

3. EASTGATE REGIONAL ITS ARCHITECTURE

The Eastgate Regional ITS Architecture describes coordination of overall system operations by defining interfaces between equipment and systems which have been or will be deployed by different organizational or operating agencies in the region. The Architecture identifies the current ITS deployment and how these systems interact and integrate with each other. It also builds on the existing systems and addresses the additional components deemed necessary to grow the ITS systems in the region over the next 15 years to accommodate specific needs and issues of participating stakeholders.

A high-level interconnect diagram for the Eastgate Regional ITS Architecture, often referred to as a “subsystem diagram” as shown in Figure 1, illustrates the architecture subsystems and primary types of

interconnections (or communications) between these subsystems. The subsystem diagram was customized to reflect the systems of the Eastgate Regional ITS Architecture. The areas highlighted with red boxes indicate the functions and services that currently exist or will likely be deployed over the next 15 years in the region.

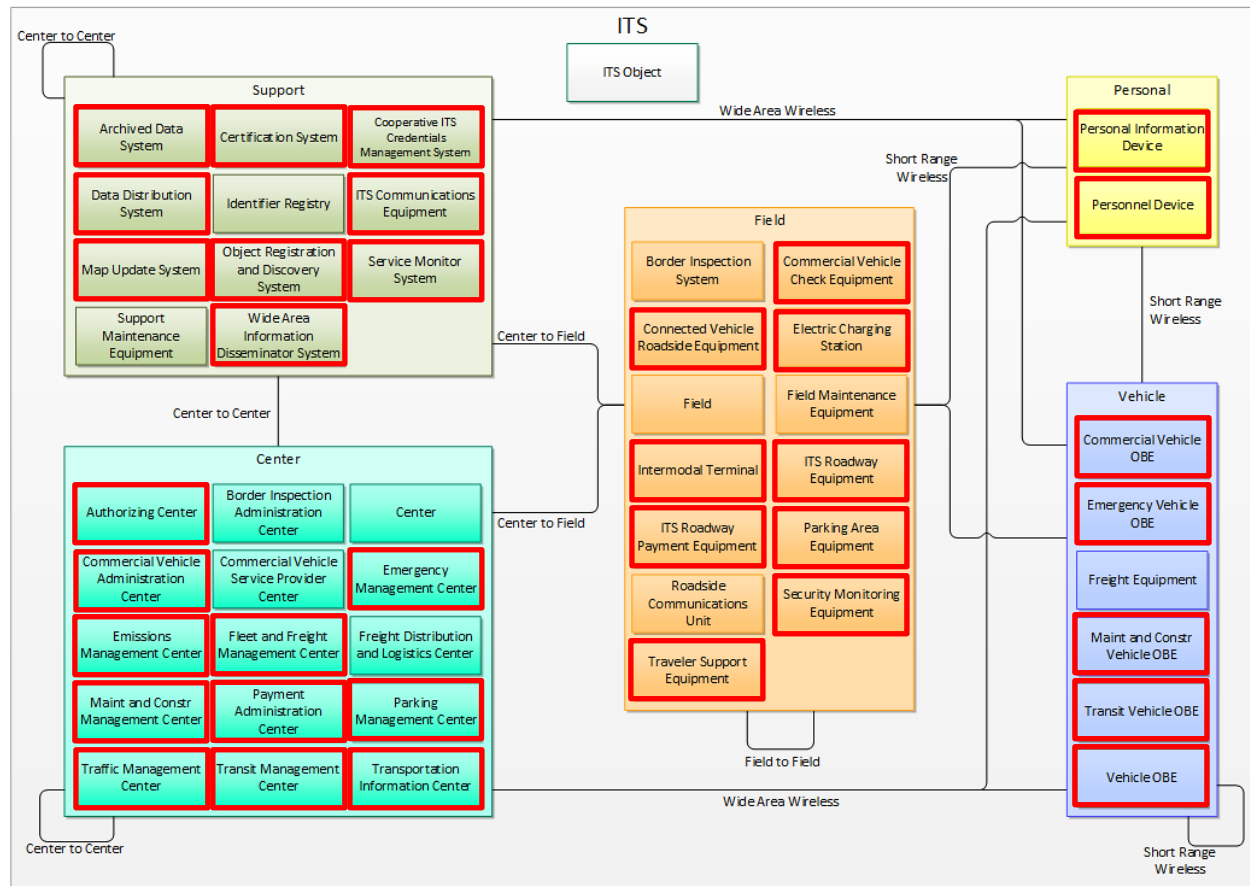

Figure 1. High-Level Interconnect Diagram

4. APPLICABLE ITS STANDARDS

ITS Standards are fundamental to the establishment of an open ITS environment that achieves the goals originally envisioned by the United States Department of Transportation (USDOT). Standards facilitate deployment of interoperable systems at local, regional, and national levels without impeding innovation as technology advances and new approaches evolve. Standards can be thought of as the glue that holds the various pieces of architecture together. They define how the communications within an ITS environment take place.

While the Eastgate Regional ITS Architecture includes various ITS applications, it does not cover every conceivable ITS technology. As such, not all ITS standards will be applicable to the existing ITS component and future deployment. Seventy-eight (78) ITS standards were identified to support communications solutions for ITS projects in the region.

It is important that stakeholders are aware of the importance of ITS standards, especially with respect to cost, risk, and interoperability issues both within the region and when connecting with other ITS architecture regions. These standards can save money in the long run, and make sure that various devices and systems “play well together”.

5. RECOMMENDED ITS PROJECTS AND IMPLEMENTATION SEQUENCING

The Eastgate Regional ITS Architecture identifies a list of ITS projects for considering and recommends a sequence in which those projects may be implemented. The project implementation sequence is based on a combination of two factors:

- **Prioritization of projects based on existing conditions and stakeholder needs.** ITS projects were prioritized to reflect a deployment path (sequence) of stakeholder needs. As technology, funding opportunities and requirements continue to evolve, it is expected that stakeholders will reevaluate and reprioritize projects periodically.
- **Project dependencies, based on how successive ITS projects can build upon one another.** Project dependencies influence the project sequencing. It is beneficial to identify the information and functional dependencies between projects.

6. DOCUMENTATION OF ITS ARCHITECTURE

The Eastgate Regional ITS Architecture is documented in three forms. The first is this report which provides high-level summaries regarding various aspects of the Architecture. The second form is an Architecture website that provides detailed architecture outputs in an organized web environment. The third is the Architecture database that is prepared using the Regional Architecture Development for Intelligent Transportation (RAD-IT) software, which is developed by FHWA for developing ITS architectures. The details of the Eastgate Regional ITS Architecture, including definitions of stakeholders, ITS inventory, projects, stakeholder roles and responsibilities, ITS services, interfaces among ITS systems, functional requirements, standards and agreements, are captured in the RAD-IT database and the Architecture website.

7. ARCHITECTURE MAINTENANCE

By its nature, an ITS architecture is not a static set of outputs. The Eastgate Regional ITS Architecture is a living document and should be modified as plans and priorities change, ITS projects are implemented, and ITS needs and services evolve in the region. An architecture maintenance plan is developed to address the needs for maintenance and updates.

Eastgate will be responsible for housing and maintaining the ITS Architecture. The general steps for architecture maintenance are:

1. Stakeholders identify changes, notify Eastgate of changes and submit a change request to Eastgate.
2. Eastgate reviews the proposed changes, offers comments, and/or asks for additional information.
3. Eastgate, in coordination with the appropriate stakeholders affected by the proposed changes, evaluates the changes and determine what impact they may have on the Architecture and/or associated documentation.
4. Upon its evaluation, Eastgate makes a decision to accept the change, reject it, or request for additional information.

5. If the decision is to accept the change, then the appropriate portions of the architecture baseline are updated by a designated member of Eastgate.
6. Once the Architecture has been modified, Eastgate publishes the updated architecture documentation, database and website.
7. Eastgate also notifies all stakeholders of architecture updates and provides information on how to obtain the latest version of the Architecture.

B. TECHNICAL REPORT

1. REGIONAL ITS ARCHITECTURE OVERVIEW

An ITS architecture describes the “big picture” for ITS deployment in terms of individual components (i.e. subsystems) that will perform the functions necessary to deliver the desired needs. It describes what is to be deployed but not how those systems are to be deployed. An ITS architecture defines the components and subsystems that must interface with each other, the functions to be performed by those subsystems and the data flows among these subsystems.

The region covered by the Eastgate Regional ITS Architecture is the Eastgate Regional Council of Governments planning area in northeast Ohio. As illustrated in Figure 2, the Eastgate planning area covers Mahoning and Trumbull counties, encompassing local, regional and state transportation agencies and transportation stakeholders.

The Architecture is a roadmap for the deployment and integration of transportation systems in the region over the next 15 years. The architecture has been developed through a cooperative effort by the transportation, transit, law enforcement, emergency management, commercial vehicle and freight management agencies. It represents a shared vision of how each agency’s systems work together by sharing information and resources to enhance transportation safety, efficiency, capacity, mobility, reliability, and security. The collaboration and information sharing among transportation stakeholders in the region helps illustrate integration options and gain consensus on systematic and cost-effective implementation of ITS technologies and systems in the region. It should also be noted that the Eastgate Regional ITS Architecture is a living document and will evolve as needs, technology, stakeholders, and funding streams change.

1.1 Purpose of a Regional ITS Architecture

The purpose of the Eastgate Regional ITS Architecture is to illustrate and document the integration of regional ITS systems to allow planning and deployment to occur in an organized and coordinated process. The Architecture helps guide the planning, implementation, and integration of ITS devices deployed and managed by multiple types of agencies that provide transportation services within the region. More specifically, the Architecture helps to accomplish the following objectives for ITS deployment in the region:

- Facilitate stakeholder coordination in ITS planning, deployment and operations;
- Reflect the current state of ITS planning and deployment within a region;
- Provide high-level planning for enhancing regional transportation systems using current and future ITS technologies; and
- Conform with ARC-IT and the FHWA Final Rule 940¹ and the FTA Final Policy on ITS Architecture and Standards.

The Final Rule and the Final Policy provide policies and procedures for implementing Section 5206(e) of the Transportation Equity Act for the 21st Century (TEA–21), pertaining to conformance with ARC-IT and Standards. The Final Rule and the Final Policy ensure that ITS projects carried out using funds from the Highway Trust Fund including the Mass Transit Account conform to ARC-IT and applicable ITS standards.

¹ FHWA Final Rule 940 is available at http://ops.fhwa.dot.gov/its_arch_imp/docs/20010108.pdf

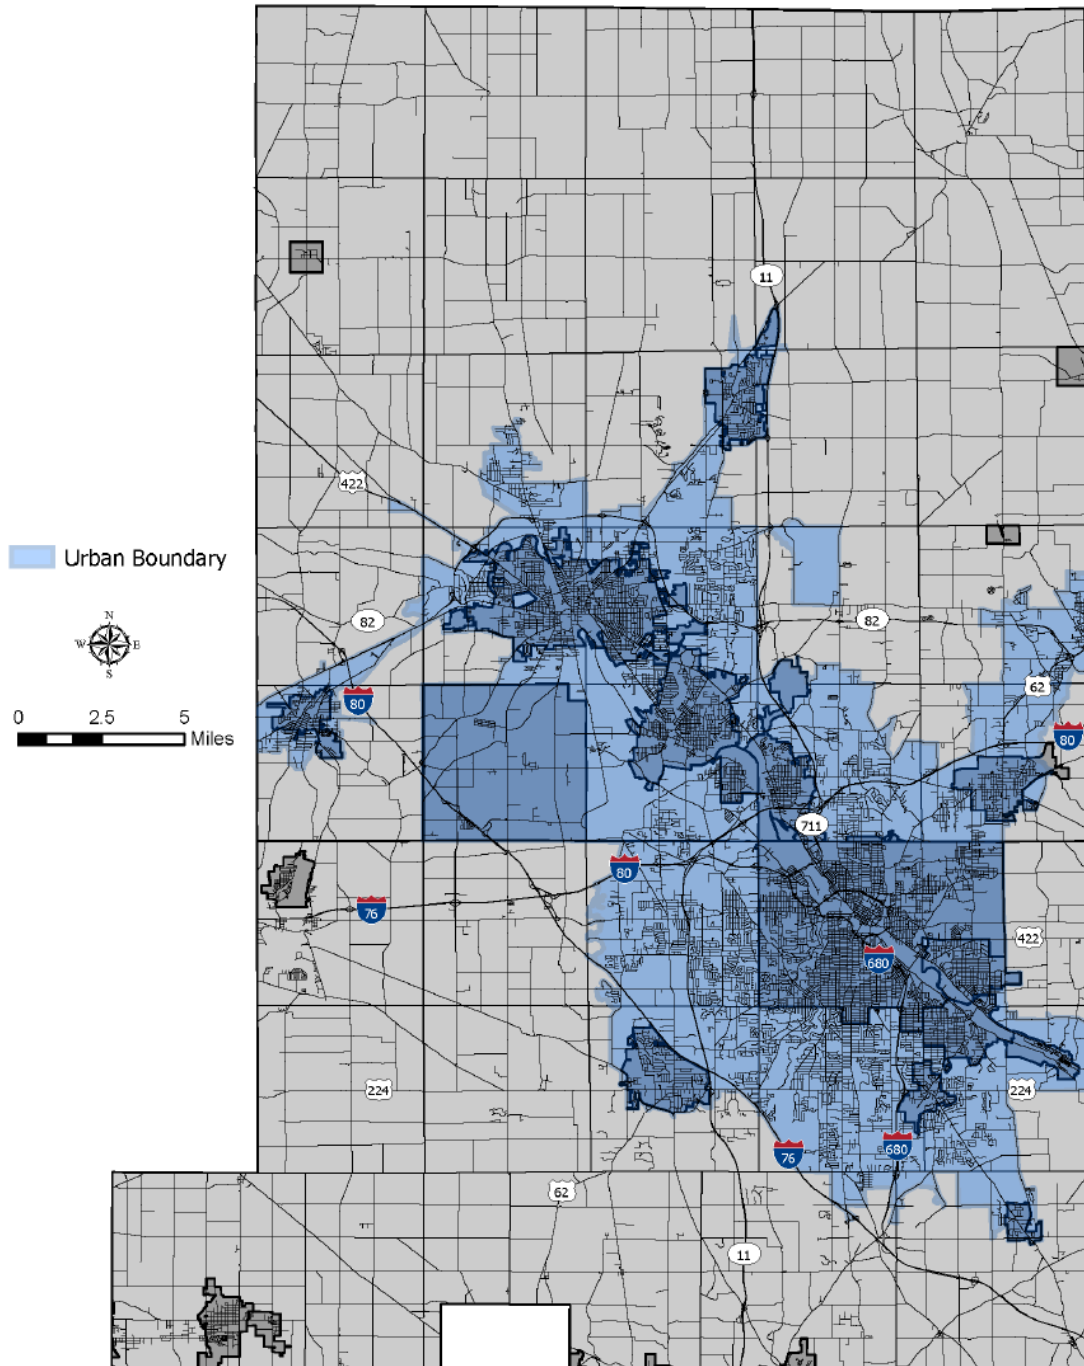

Figure 2. Eastgate Planning Area

ARC-IT is a tool to guide the development of regional ITS architectures. It is a common framework that guides agencies in establishing ITS interoperability and helps them choose the most appropriate strategies for processing transportation information, implementing and integrating ITS components and systems, and improving operations. The Eastgate Regional ITS Architecture is a specific application of the framework specified in ARC-IT, tailored to the needs of the transportation stakeholders in the Eastgate region.

1.2 Architecture Development Process

The process used to develop the Eastgate Regional ITS Architecture is illustrated in Figure 3. This figure shows six general steps in the “life-cycle” of an ITS architecture. In the first four steps, the ITS architecture components are developed and then these components are used and maintained in steps 5 and 6. The development process begins with basic scope definition and team building and moves through increasingly detailed steps, culminating in specific architecture outputs and documents that will guide the “implementation” of the ITS architecture.

The key to the ITS architecture development process is to identify stakeholder needs, identify ITS projects to address those needs, and define project sequencing. The project definition outlines the project concepts and the associated details including project title, stakeholder, project scope, costs, benefits and the service packages defined in the Eastgate Regional ITS Architecture. The project sequencing provides an approximate timeframe in which an ITS project may be implemented based on the understanding of the projects, project dependencies of the project, as well as other existing or planned ITS systems.

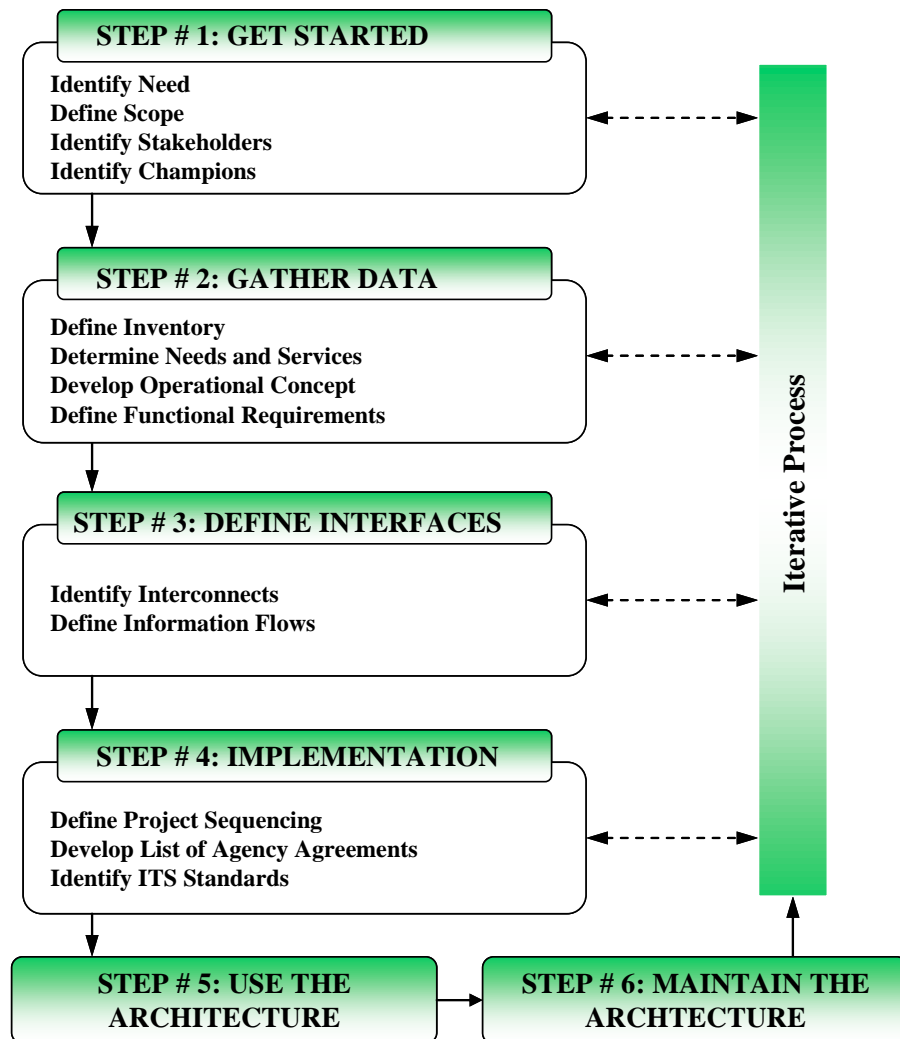

Figure 3. ITS Architecture Development Process

1.3 Systems Engineering

Systems Engineering is a phrase used to describe a cyclical process of planning, designing, implementing, testing, operating, and maintaining an ITS system. Essentially, this process covers the entire useful life of the system. Systems Engineering is a multi-step process that requires agencies to ask critical questions about how the technical aspects of the system will work together. This is often overlooked in complex systems. Figure 4 graphically illustrates the Systems Engineering process in what is often referred to as the “Vee” diagram. The purpose of a “V” in the diagram is to show how the final deliverables relate back to the early decisions (the right side relates directly back to the left side). That way there are no surprises when the system is finally delivered. For example, while a system is being designed the various functions are documented as requirements, and then when the system is being built, these same functional requirements are compared to what was actually delivered.

The Systems Engineering process shows how each step of the process builds on the previous one and is reliant on a system of back checking to ensure that the project is being designed and constructed based on its originally intended purpose. Systems Engineering is a risk management tool that sets expectations and then verifies that those expectations are met. It also enables a change management system so that unexpected issues can be incorporated into the process.

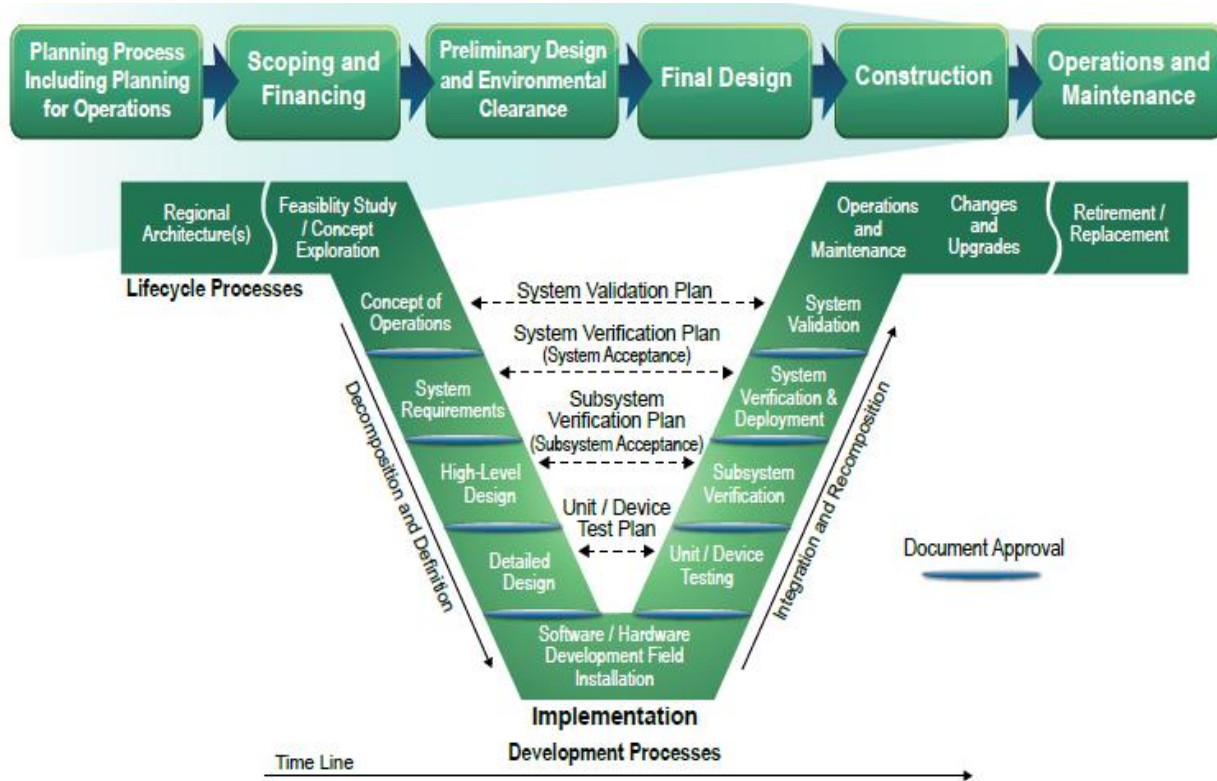

Figure 4. Systems Engineering V-Diagram

1.4 FHWA and FTA Requirements on ITS Architectures

FHWA Rule 940 (http://ops.fhwa.dot.gov/its_arch_imp/docs/20010108.pdf) provides policies and procedures for implementing Section 5206(e) of the Transportation Equity Act for the 21st Century (TEA–21), Public Law 105–178, 112 Stat. 457, pertaining to conformance with ARC-IT and Standards. The rule states, in part, that the final design of all ITS projects funded with Highway Trust Funds must accommodate the interface requirements and information exchanges as specified in the regional ITS architecture.

For federally funded ITS projects, several steps need to be followed as part of the systems engineering analysis and Rule 940 requirements. Rule 940 states that the systems engineering analysis shall include, at a minimum:

- Identification of portions of the regional ITS architecture being implemented (or if a regional ITS architecture does not exist, the applicable portions of ARC-IT)
- Identification of participating agencies roles and responsibilities
- Requirements definitions
- Analysis of alternative system configurations and technology options to meet requirements
- Procurement options
- Identification of applicable ITS standards and testing procedures
- Procedures and resources necessary for operations and management of the system

The rule requirements are applicable for all ITS projects funded through the Highway Trust Fund account. Conformity with the Rule 940 requirements is required for both routine and non-routine projects. However, with routine projects, the effort and the scope of systems engineering analysis should be minimal. For non-routine projects, the scale of the systems engineering analysis depends on the scope of the project.

While the use of the architecture and the systems engineering approach is mandatory for federally funded projects, project developers are encouraged to use this approach for any ITS project using state or local funds, especially for projects that integrate with other systems in the region.

The Eastgate Regional ITS Architecture is a specific application of the framework specified in ARC-IT, tailored to the needs of the transportation stakeholders in the region. The Architecture was developed following the systems engineering approach and the requirements set forth in FHWA Final Rule 940.

2. PROGRESS AND ACCOMPLISHMENTS

The Eastgate Regional ITS Architecture was initially developed in 2003. The Architecture was subsequently updated in 2011 and again in 2014. An ITS strategic plan was developed with the 2011 architecture update effort and updated in 2014. The ITS planning efforts in 2011 and 2014 resulted in a list of recommended actions to the region. Over the past seven years, stakeholders in the region have expanded their ITS capabilities and implemented additional devices and technology. Table 1 highlights the key accomplishments in ITS within the region since 2014.

Table 1. Key ITS Accomplishments in the Region since 2014

Lead Agency	Key Accomplishments
Ohio Department of Transportation (ODOT)	Implemented the OHGO website and mobile app to deliver traveler information to the public. This included providing personalized traveler information on a subscription basis and delivering the information to smartphones, tablets, and personal computing devices.
Mahoning and Trumbull Counties	Developed a regional evacuation plan that covered the two-county area in case of an emergency affecting mass areas. This included identifying needs for signal upgrades and coordination along the major evacuation routes.
Trumbull County	<ul style="list-style-type: none"> Completed the North River Road / Elm Road Safety Enhancement Project that included constructing a skid resistant surface course, upgrading pavement markings, improving traffic lane alignments, and upgrading the existing traffic signals to optimize traffic timing and flow. Completed Warren Sharon Road / Howland Wilson Road Intersection Project. This intersection improvement project consisted of a signal improvement and the addition of left turn lanes at the intersection of Warren Sharon Road and Howland Wilson Road in Howland Township. Installed automated vehicle location (AVL) system for the county maintenance vehicles.
Western Reserve Transit Authority (WRTA)	<ul style="list-style-type: none"> Installed cameras at certain locations to provide surveillance at stations and surrounding areas for security purposes. Installed automated signs, annunciators and wireless Internet feed on buses.
City of Newton Falls	Installed preemption for emergency vehicles (fire, EMS and police vehicles) on all approaches for four signalized intersections: W. Broad at Ridge/Windham, W. Broad at Canal, Broad at Center, and E. Broad at Milton.

3. STAKEHOLDER INVOLVEMENT

Stakeholders are commonly considered to be those who own or operate ITS systems in the region as well as those who have an interest in regional transportation issues. Stakeholders provide crucial input regarding the region's transportation investment and ITS deployments; therefore, stakeholder participation and coordination is critical to the success of the ITS architecture development.

The Eastgate Regional ITS Architecture includes a wide range of stakeholders, and key stakeholders were identified at the beginning of the architecture development process. Information on current and potential ITS deployment was gathered through a survey distributed to stakeholders in June 2021. The survey presented stakeholders with a list of common transportation issues/needs that can be addressed through the use of ITS technologies, and asked stakeholders to rank the severity of the issue as High, Medium, Low, or Not Applicable in the region. The survey also asked stakeholders to list the top 5 needs and challenges that would like to see addressed by the update to the Eastgate Regional ITS Architecture. A total of 11 surveys were completed by stakeholders.

Stakeholders were invited to a stakeholder meeting in December 2021 where they were presented with the draft architecture. In addition, facilitators guided stakeholders through a listing of recommended ITS projects that were identified based on stakeholder needs and an analysis of current ITS capabilities in the region. Stakeholders were encouraged to review, provide comments and add missing information to the architecture and the recommended ITS projects.

4. REGIONAL ITS ARCHITECTURE COMPONENTS

This section describes the following processes that were followed in developing the Eastgate Regional ITS Architecture through the use of RAD-IT software. Details of the architecture are presented on the website for the Eastgate Regional ITS Architecture that can be found on the Eastgate's website.

4.1 Inventory

The inventory of the Eastgate Regional ITS Architecture contains all of the existing and future elements of ITS technology within the region. The inventory of elements previously identified for the Eastgate region in 2014 was used as a starting point in updating the ITS inventory. These elements were updated and new elements were added based on the information gathered through stakeholder survey responses and follow-up discussions.

ITS elements within the Inventory represent the range of ITS devices and systems. Figure 5 displays that the five types of inventory elements that can exist within an ITS Architecture (represented by the five colored boxes in the figure). ITS elements can exist:

- On vehicles (i.e. police cars, snow plows, etc.)
- In the field (i.e. traffic signals)
- At a center (i.e. Traffic Management Center)
- Personally in the hands of travelers (i.e. computers, smartphones, etc.)
- As support systems (i.e. back-office map systems, etc.)

The technical functions that each of these elements perform are defined by ARC-IT as Subsystems and illustrated in Figure 5.

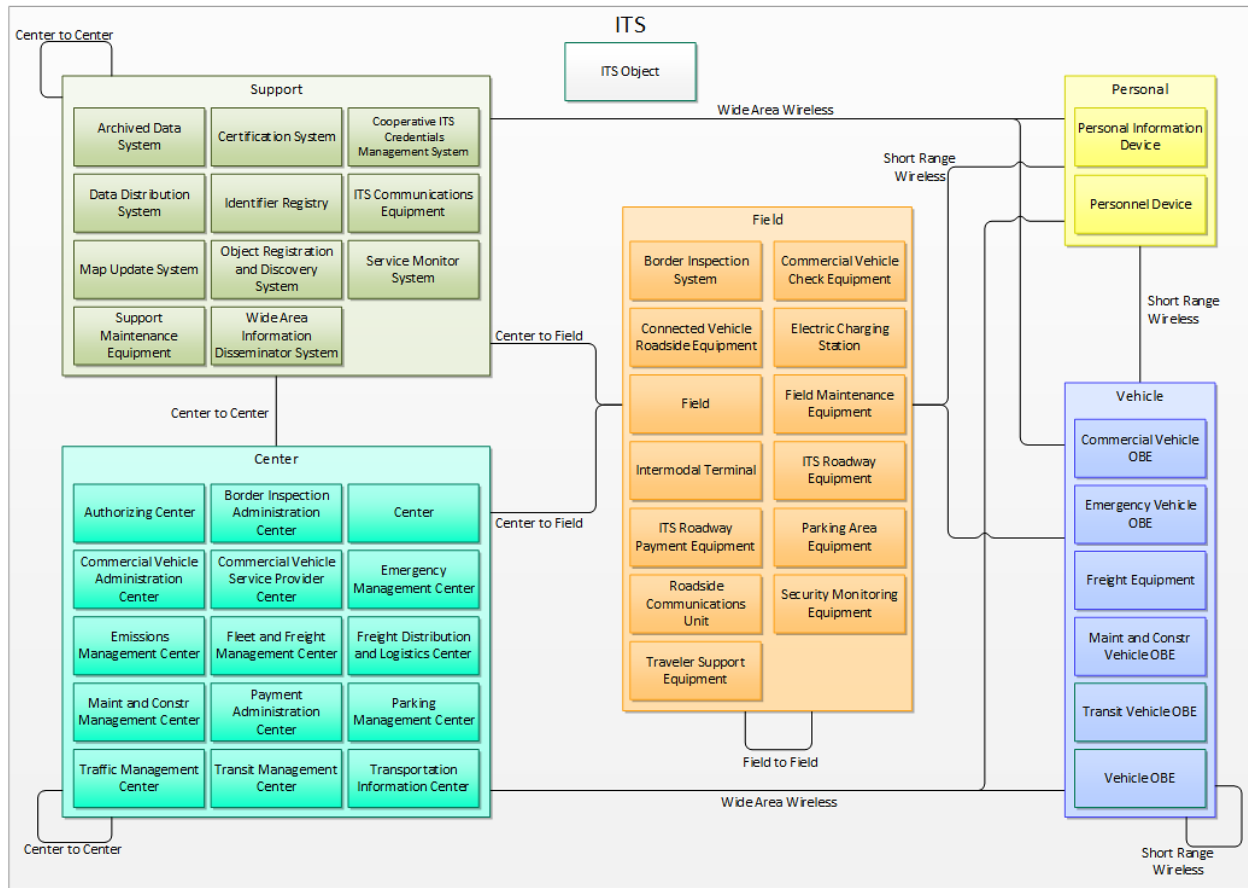

Figure 5. ARC-IT Subsystems and Interconnections

In addition to Subsystem elements, there are additional elements added to the Inventory defined by ARC-IT as Terminators. These represent the people, systems, and general environment that interface with the Subsystem elements. Terminators typically represent the beginning or end of a flow of information in the ITS Architecture. No technical or functional requirements are assigned to terminators because they are the points outside the system boundaries where the architecture “plugs in” to the outside world.

A detailed listing of all the ITS elements in the Eastgate region can be found in the Architecture website. Each ITS element is documented by the associated stakeholder(s), its status (e.g. existing or planned), and a brief description for each element. Based on its functionalities, each element is also mapped to the various types of subsystems and terminators defined by ARC-IT.

4.2 Service Packages

Service packages of an ITS architecture define a “service-oriented” perspective of how an ITS architecture can be structured. Service packages are a convenient way to assemble ITS components to address frequently needed services without having to itemize the components. This can be compared to buying a car. In one purchase you acquire a complex set of systems such as engine, drive train, suspension, cargo handling, etc.) In the same way, service packages present how the ITS elements (and their assigned subsystems and terminators) work together to deliver a given ITS service, as well as the flows of information that connect those ITS elements with other important external systems. They are tailored to fit real world transportation problems and needs. Service packages enable transportation planners and decision makers to select appropriate ITS services and solutions that satisfy local and statewide needs.

All 150 service packages in ARC-IT (Version 9.0) were considered for their applicability to the Eastgate region. Table 2 summarizes the status of ITS deployment with respect to service packages that were applicable to the region. A detailed list of applicable service packages is presented in the Architecture website.

Table 2. Service Packages for the Eastgate Regional ITS Architecture

Service Package	Service Package Name	Service Package Status
CVO01	Carrier Operations and Fleet Management	Planned
CVO02	Freight Administration	Planned
CVO03	Electronic Clearance	Existing
CVO05	Commercial Vehicle Parking	Planned
CVO06	Freight Signal Priority	Planned
CVO08	Smart Roadside and Virtual WIM	Planned
CVO09	Freight-Specific Dynamic Travel Planning	Planned
CVO10	Road Weather Information for Freight Carriers	Planned
CVO12	HAZMAT Management	Planned
DM01	ITS Data Warehouse	Planned
MC01	Maintenance and Construction Vehicle and Equipment Tracking	Existing
MC02	Maintenance and Construction Vehicle Maintenance	Existing
MC04	Winter Maintenance	Planned
MC05	Roadway Maintenance and Construction	Planned
MC06	Work Zone Management	Planned
MC07	Work Zone Safety Monitoring	Planned
MC08	Maintenance and Construction Activity Coordination	Planned
MC09	Infrastructure Monitoring	Planned
PM01	Parking Space Management	Planned
PM04	Regional Parking Management	Planned
PM06	Loading Zone Management	Planned
PS01	Emergency Call-Taking and Dispatch	Existing
PS02	Emergency Response	Planned
PS03	Emergency Vehicle Preemption	Existing
PS07	Incident Scene Safety Monitoring	Planned
PS08	Roadway Service Patrols	Planned
PS09	Transportation Infrastructure Protection	Planned
PS10	Wide-Area Alert	Existing
PS12	Disaster Response and Recovery	Planned
PS13	Evacuation and Reentry Management	Planned
PS14	Disaster Traveler Information	Planned
PT01	Transit Vehicle Tracking	Existing
PT02	Transit Fixed-Route Operations	Existing
PT03	Dynamic Transit Operations	Existing
PT04	Transit Fare Collection Management	Planned
PT05	Transit Security	Existing

Service Package	Service Package Name	Service Package Status
PT06	Transit Fleet Management	Planned
PT07	Transit Passenger Counting	Planned
PT08	Transit Traveler Information	Existing
PT09	Transit Signal Priority	Planned
PT11	Transit Pedestrian Indication	Planned
PT12	Transit Vehicle at Station/Stop Warnings	Planned
PT13	Vehicle Turning Right in Front of a Transit Vehicle	Planned
PT14	Multi-modal Coordination	Planned
PT16	Route ID for the Visually Impaired	Planned
PT17	Transit Connection Protection	Planned
ST05	Electric Charging Stations Management	Planned
ST08	Eco-Approach and Departure at Signalized Intersections	Planned
SU01	Connected Vehicle System Monitoring and Management	Planned
SU02	Core Authorization	Planned
SU03	Data Distribution	Planned
SU04	Map Management	Planned
SU05	Location and Time	Planned
SU06	Object Registration and Discovery	Planned
SU08	Security and Credentials Management	Planned
SU09	Device Certification and Enrollment	Planned
SU12	Vehicle Maintenance	Planned
TI01	Broadcast Traveler Information	Existing
TI02	Personalized Traveler Information	Existing
TI06	Dynamic Ridesharing and Shared Use Transportation	Planned
TI07	In-Vehicle Signage	Planned
TM01	Infrastructure-Based Traffic Surveillance	Existing
TM02	Vehicle-Based Traffic Surveillance	Planned
TM03	Traffic Signal Control	Existing
TM04	Connected Vehicle Traffic Signal System	Planned
TM06	Traffic Information Dissemination	Existing
TM07	Regional Traffic Management	Planned
TM08	Traffic Incident Management System	Existing
TM10	Electronic Toll Collection	Existing
TM12	Dynamic Roadway Warning	Planned
TM13	Standard Railroad Grade Crossing	Planned
TM14	Advanced Railroad Grade Crossing	Planned
TM15	Railroad Operations Coordination	Planned
TM19	Roadway Closure Management	Planned
TM21	Speed Harmonization	Planned
TM22	Dynamic Lane Management and Shoulder Use	Planned
VS01	Autonomous Vehicle Safety Systems	Planned
VS02	V2V Basic Safety	Planned
VS03	Situational Awareness	Planned

Service Package	Service Package Name	Service Package Status
VS05	Curve Speed Warning	Planned
VS06	Stop Sign Gap Assist	Planned
VS07	Road Weather Motorist Alert and Warning	Planned
VS08	Queue Warning	Planned
VS09	Reduced Speed Zone Warning / Lane Closure	Planned
VS12	Pedestrian and Cyclist Safety	Planned
VS13	Intersection Safety Warning and Collision Avoidance	Planned
VS14	Cooperative Adaptive Cruise Control	Planned
VS15	Infrastructure Enhanced Cooperative Adaptive Cruise Control	Planned
VS16	Automated Vehicle Operations	Planned
WX01	Weather Data Collection	Existing
WX02	Weather Information Processing and Distribution	Existing
WX03	Spot Weather Impact Warning	Planned

4.3 Stakeholders' Operational Roles and Responsibilities

An operational concept defines each stakeholder's current and future roles and responsibilities within the ITS systems. Defining the roles and responsibilities of the participating stakeholders in the region is an important step in realizing the common goal of an interoperable ITS system throughout the region.

A list of the stakeholders' operational roles and responsibilities is contained in the Architecture website. These roles and responsibilities have been defined based on existing documents (for existing ITS systems), as well as recommended future ITS projects (for proposed systems). Together, these roles and responsibilities define the Operational Concept for the ITS Architecture, and provide an overview how ITS services operate within the region.

4.4 Functional Requirements

A functional requirement is a task or activity that is currently performed or will be performed by each system in the region to provide the required regional ITS services. The ARC-IT has pre-defined all possible functional requirements that are associated with respective subsystems in each service package. The regional architecture is created through selecting those functional requirements that apply from this master list of functional requirements.

The process of selecting the functional requirements for the Eastgate Regional ITS Architecture began with the mapping of functional areas (Functional Objects) to service packages and associated ITS elements. The functional requirements of each functional object were then tailored to represent the specific local agency functions performed. RAD-IT software is then used to produce lists and requirement definitions that can be interpreted by the end users.

A detailed listing of the Functional Requirements of all ITS Inventory elements in the Eastgate region is contained in the Architecture website.

4.5 Interfaces

While it is important to identify the various ITS systems and stakeholders as part of the Architecture, a primary purpose of the Eastgate Regional ITS Architecture is to identify the connectivity between systems. The two ways to describe this connectivity are:

- **Architecture Interconnects** define the connections between equipment and systems which may be deployed by the agencies throughout the region. In other words, what entities interact with each other.
- **Architecture (Information) Flows** define a high-level information exchange associated with each interconnect between equipment and systems. In other words, what information is passed along the interconnect paths.

An example of an interconnect diagram is illustrated in Figure 6.

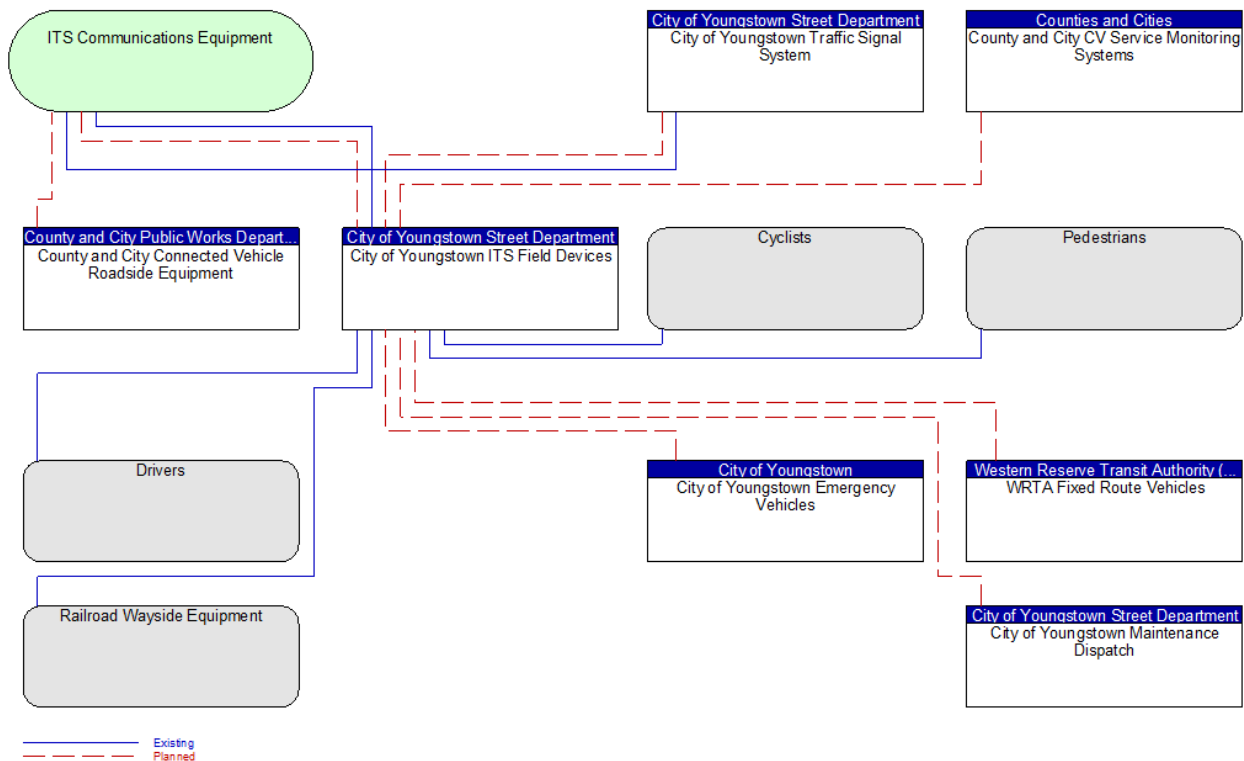

Figure 6. Interconnect Diagram Example: City of Youngstown ITS Field Devices

Figure 7 illustrates the architecture flow diagram between the WRTA Fixed Route Dispatch and the WRTA Fixed Route Vehicles in the Eastgate Regional ITS Architecture. Architecture (information) flows provide a high-level description of information exchanges associated with each interconnect path between equipment and systems. From these diagrams the stakeholders can easily identify the existing or potential information exchange between agencies and systems. This provides a framework for analyzing how elements are related and thus identifies the areas for potential coordination and cooperation among agencies. Quite often, from these diagrams agencies can identify missing communication flows that should occur, leading to refinements during the lifecycle of the system.

Figure 7. Architecture Flow Diagram: WRTA Fixed Route Dispatch and Fixed Route Vehicles

The ARC-IT provides guidance in identifying potential information to be exchanged between commonly used ITS elements in the Inventory, and the RAD-IT software is used to generate the architecture flow diagrams between ITS elements in the Inventory.

A detailed listing of the interconnects and architecture flows of all ITS Inventory elements in the Eastgate region is contained in the Architecture website.

4.6 Standards

Identification of ITS technical standards that support interfaces in the regional ITS architecture are often not understood by stakeholders, so ARC-IT was created to provide the stakeholders with easy access to appropriate ITS standards that can be specifically applied to an ITS project. A summary of this task process is as follows:

- Using information flows identified in Step 3, identify relevant ITS standards for the region.
- Assess the ITS standard maturity and develop agreements for use of interim standards when determined necessary.
- Identify other regional and/or statewide standards that might apply.

As previously noted, it is important that stakeholders are aware of the importance of ITS standards, especially with respect to cost, risk, and interoperability issues both within the region and when connecting with other ITS architecture regions. These standards can save money in the long run, and make sure that various devices and systems “play well together”.

A list of ITS Standards identified by the RAD-IT as applicable to the Eastgate region is contained in the Architecture website.

4.7 Agreements

The Eastgate Regional ITS Architecture also provides an institutional framework for the deployment of ITS in the region. Institutional interoperability involves cooperation and coordination between various agencies and jurisdictions to achieve seamless functionality, regardless of agency boundaries or differences in neighboring agency systems. Because the regional architecture identifies systems that require agencies to contribute resources and manpower to operate, inter-agency agreements are often needed to define the roles and responsibilities of each party.

There are several types of arrangements associated with the interfaces identified in the Eastgate Regional ITS Architecture:

- Information sharing and exchanges between systems require knowledge of the transmission protocol and data formats to ensure compatibility.
- Coordinating field device operations owned by different agencies requires defined procedures for submitting message requests and rules governing when such requests can be honored. Such coordination may be done with informal arrangements such as a Memoranda of Understanding (MOU).
- Sharing control of field devices operated by different agencies sometimes involves liability issues, which leads to more formal agreements.
- Coordinated incident response may also require formal agreements, but also requires group training of personnel from various agencies.

In general, agreements may be obtained for data sharing, establishing common procedures, supporting regional operations, cost effective maintenance arrangements, and personnel training.

Some common types of agreements are listed in Table 3. The agreement process may begin with something as simple as a handshake agreement. However, once interconnections and integration of systems begin, agencies may want to have more formalized agreements in place. A documented agreement will aid agencies in planning their operational costs, understanding their respective roles and responsibilities, and build trust for future projects. Formal agreements may be necessary where funding or financial arrangements are defined or participation in large regionally significant projects is required. Formal agreements also provide a means for sustaining the stakeholders' expectations when personnel and administration changes occur.

Table 3. Common Types of Agreements for ITS

Type of Agreement	Description
Handshake Agreement	<ul style="list-style-type: none"> ▪ Early agreement between one or more partners ▪ Not recommended for long term operations.
Memorandum of Understanding (MOU)	<ul style="list-style-type: none"> ▪ Initial agreement used to provide minimal detail and usually demonstrating a general consensus. ▪ Used to expand a more detailed agreement like an Interagency Agreement that may be broad in scope but contains all of the standard contract clauses required by a specific agency. ▪ May serve as a means to modify a much broader Master Funding Agreement, allowing the master agreement to cover various ITS projects throughout the region and the MOUs to specify the scope and differences between the projects.
Interagency Agreement	<ul style="list-style-type: none"> ▪ Between public agencies (i.e., transit authorities, cities, counties, etc.) for operations, services or funding ▪ Documents responsibility, functions and liability at a minimum.
Intergovernmental Agreement	<ul style="list-style-type: none"> ▪ Between governmental agencies (i.e., Agreements between universities and State DOT, MPOs and State DOT, etc.)
Operational Agreement	<ul style="list-style-type: none"> ▪ Between any agency involved in funding, operating, maintaining or using the right of way of another public or private agency. ▪ Identifies respective responsibilities for all activities associated with shared systems being operated and / or maintained.
Funding Agreement	<ul style="list-style-type: none"> ▪ Documents the funding arrangements for ITS projects (and other projects) ▪ Includes at a minimum standard funding clauses, detailed scope, services to be performed, detailed project budgets, etc.
Master Agreements	<ul style="list-style-type: none"> ▪ Standard contract and / or legal verbiage for a specific agency and serving as a master agreement by which all business is done. These agreements can be found in the legal department of many public agencies. ▪ Allows states, cities, transit agencies and other public agencies that do business with the same agencies over and over (i.e., cities and counties) to have one Master Agreement that uses smaller agreements (i.e., MOUs, Scope of Work and Budget Modifications, Funding Agreements, Project Agreements, etc.) to modify or expand the boundaries of the larger agreement to include more specific language.

A summary of the ITS Agreements for the region were documented in the RAD-IT database and can be found in the Architecture website.

5. RECOMMENDED ITS PROJECTS AND IMPLEMENTATION SEQUENCING

The ITS projects included in the Eastgate Regional ITS Architecture were identified based on the following sources:

- Previous version of the Eastgate Regional ITS Architecture developed in 2014
- Stakeholder surveys, inputs and feedback
- Eastgate 2040 Metropolitan Transportation Plan
- Eastgate Transportation Improvement Program (FY2021 – FY2024)
- Documents and reports of ongoing studies and projects within the region

A project sequence defines the order in which ITS projects may be implemented. A good sequence is based on a combination of two factors:

- **Prioritization of projects based on existing conditions and stakeholder needs.** The ITS projects were prioritized to reflect a deployment path (sequence). Although the information collected through stakeholder surveys and meetings was the basis of the ITS Architecture, real world conditions of changing technology, funding opportunities and public demand continue to evolve. It is expected that the stakeholders will reevaluate and reprioritize projects frequently to keep up with these imposed changes.
- **Projects often depend on prior projects being completed.** For example, a fiber optic network would need to be in place before a set of detectors are constructed to provide a means to communicate with the detection system. These project dependencies influence the project sequencing. Therefore, it is important to identify these dependencies between projects during the planning stages.

In most cases, the sequence of currently planned projects has already been programmed and can simply be extracted from existing transportation plans. Successive projects will then be added to the sequence based on the project dependencies and other planning factors.

The project timeframes provide a means to position each project along the architecture's lifetime. This enables the scheduling of funds and resources to deliver the projects in an appropriate sequence. Three timeframe categories are used, and their definitions are described below:

Table 4. Project Implementation Timeframes

Category	Time Frame	Year of Deployment
Short Term	0 – 5 years	2021 – 2026
Medium Term	6 – 10 years	2026 – 2031
Long Term	11 years and beyond	2031 and beyond

The Eastgate Regional ITS Architecture represents a roadmap for transportation systems deployment and integration in the region over the next 15 years. A list of ITS projects that have currently been planned or considered over the next 15 years is identified in Table 5. Through the above process, the recommended ITS project sequencing was determined. The list was further refined to establish which projects were allocated to the short term (within 5 years), medium term (6 to 10 years), and long term (over 10 years). This provided a priority for the list of projects denoting a general order for project implementation.

Table 5. List of Future ITS Projects and Initiatives

Project	Project Description	Project Timeframe	Lead Agency
Short Term Projects			
City of Warren Safe Route to School Phase 2	This project will replace 12 school zone 20 MPH flasher units, replace 74 pedestrian signals, install pedestrian signals at 3 signalized locations and 1 HAWK signal, install high visibility thermoplastic crosswalk markings where needed, all within the City of Warren. (TIP PID# 110953)	Short	City of Warren
City of Warren Traffic Signal Upgrade	This project will modernize the City of Warren's existing traffic signals through replacements or upgrades. This includes the signal upgrades on various routes within the city (TIP (PID# 107235 - including replacing 12 school zone flasher units and 74 pedestrian signals, installing pedestrian signals at 3 locations and 1 HAWK signal). This project may also include replacing or upgrading traffic signals, controllers, and other equipment. Traffic signal controllers may be upgraded to support advanced features, including adaptive traffic control system, high-resolution traffic data collection, transit signal priority, emergency vehicle preemption, and/or connected vehicle applications.	Short	City of Warren
City of Warren Traffic Signal Timing Optimization and Coordination	This project represents updates to arterial traffic signal system timings and coordination within the City of Warren. Traffic signal timing and coordination improvements can reduce congestion and delays on arterial roads.	Short	City of Warren
ODOT and City of Warren Traffic Signal Coordination	This project will create an interconnect between the City of Warren and ODOT to allow signal timing coordination across jurisdictional boundaries.	Short	City of Warren / ODOT
City of Warren Maintenance Vehicle AVL	This project will install an AVL system for the City of Warren's maintenance vehicles to track vehicle locations. Remote vehicle health monitoring and diagnostic capabilities may be included.	Short	City of Warren

Project	Project Description	Project Timeframe	Lead Agency
City of Youngstown Traffic Signal Upgrade	This project will modernize Youngstown's existing, traffic signals through replacements or upgrades. This includes replacing or upgrading traffic signals, controllers, and other equipment. Traffic signal controllers will be upgraded to support advanced features, including adaptive traffic control system, high-resolution traffic data collection, transit signal priority, emergency vehicle preemption, and/or connected vehicle applications. This project also includes (1) the signal upgrade along Mahoning Ave that is included in the TIP (PID# 107228); and (2) signal upgrades at 17 locations throughout the city (PID# 102542).	Short	City of Youngstown
City of Youngstown Traffic Signal Timing Optimization and Coordination	This project represents updates to arterial traffic signal system timings and coordination within the City of Youngstown. Traffic signal timing and coordination improvements can reduce congestion and delays on arterial roads.	Short	City of Youngstown
City of Youngstown Emergency Vehicle Preemption	This project will install Emergency Vehicle Preemption (EVP) technology to improve emergency response times along arterial signalized corridors to the scene of an incident.	Short	City of Youngstown
City of Youngstown Traffic and Travel Time Detection System	This project will add detection capabilities to key arterials in the City of Youngstown to collect traffic volumes, speeds, and vehicle classification. It could also potentially include Bluetooth sensors for detecting travel times.	Short	City of Youngstown

Project	Project Description	Project Timeframe	Lead Agency
Youngstown Smart2 Network	This project includes the following ITS elements: (1) Autonomous Transit Shuttles, (2) HAWK Ped Crossing System, and (3) Digital Wayfinding Kiosks. Autonomous Transit Shuttle: through an innovative partnership with DriveOhio, an autonomous shuttle service will be provided on Fifth Avenue, Rayen Avenue, and Park Avenue, capitalizing on existing roadway capacity along these arterials. DriveOhio will provide the autonomous vehicle technical, legislative and procurement support. HAWK Ped Crossing System: one system will be installed on 5th Ave. Digital Wayfinding Kiosks: digital wayfinding kiosks will provide real time transit information for all autonomous shuttle and connecting routes. Kiosks will monitor air pollution, temperature, and available parking spaces. Spaced at one per major street block, these kiosks will provide free high-speed Wi-Fi, wayfinding services for tourists, and device charging. Leased digital advertising will cover long- term operational and maintenance costs.	Short	City of Youngstown
Village of Poland Signal Upgrade	This project will upgrade 10 traffic signals on various routes within the village (TIP PID# 107226).	Short	Village of Poland
Municipal Computer Aided Dispatch to Emergency Vehicles	Integrating the computer aided dispatch to the emergency management center that will allow the operators to dispatch emergency response vehicles to the scene more rapidly.	Short	Municipalities
Municipal Maintenance Vehicle AVL	This project will install an AVL system for municipal agency snow plows and maintenance vehicles to track vehicle locations. Remote vehicle health monitoring and diagnostic capabilities are included. Municipalities may opt to select the AVL system used by their respective County and add municipal agency vehicles as part of the County's AVL system.	Short	Municipalities
Mahoning County Traffic Signal Upgrade	This project includes intersection improvement and signalization upgrade on various routes within the county, including the following projects identified in the TIP: (1) South Avenue from Matthews Road to Midlothian Boulevard in Boardman Township (PID# 95446); and (2) Intersection at Raccoon Road and New Road (PID# 107273).	Short	Mahoning County

Project	Project Description	Project Timeframe	Lead Agency
Trumbull County Traffic Signal Timing Optimization, Coordination and Interconnects	This project represents updates to the timings and coordination of traffic signals operated by Trumbull County. Traffic signal timing and coordination improvements can reduce congestion and delays on arterial roads.	Short	Trumbull County
Trumbull County Curve Speed and Visibility Warning System	The project will deploy a curve speed and visibility warning system on Niles Vienna Road near Girard Lake. The system includes roadside speed detection and warning devices to present warnings to drivers. When the speeds of approaching vehicles are above a certain threshold, the system provides alerts to drivers who are approaching a curve at an unsafe speed. The system can also include a visibility sensor to detect poor visibility conditions due to fog. Alerts are based on the vehicle speed and visibility conditions as factors in assessing when to provide alerts for unsafe speeds.	Short	Trumbull County
Trumbull County Newton Falls Bailey Road Curve Warning System	This project will deploy two curve warning systems at the 90° bends at the railroad underpass on Newton Falls Bailey Road. The system will include a vehicle speed sensor and an active warning sign to alert drivers who are approaching the curve at an unsafe speed. The underpass is narrowed to a one-lane road. The active warning sign could also provide additional warnings to drivers about traffic approaching the underpass from the opposite direction so they could be prepared to slow down or stop to avoid conflicts.	Short	Trumbull County

Project	Project Description	Project Timeframe	Lead Agency
Trumbull County Rural Intersection Warning System	This project will install active intersection warning systems at rural intersections with safety issues and concerns. The system consists of field equipment at key intersections that detects a vehicle's presence that cannot be seen by oncoming vehicles due to poor geometric field conditions. The field equipment will send a notification to additional field equipment that will alert drivers with information indicating when entry into an intersection is unsafe. The intersection of Austintown Warren Road and Salt Springs Road is a candidate location for such a system. Detection equipment can be installed on Austintown Warren Road on the approaches to the intersection. A warning sign can be installed at the intersection to provide warnings to drivers on Salt Springs Road about approaching vehicles from Austintown Warren Road. Similar systems could be installed at other locations with high intersection crash history.	Short	Trumbull County
ODOT CCTV Upgrades and Expansion	This project will add CCTV cameras along ODOT roadways to expand traffic monitoring coverage.	Short	ODOT
ODOT DMS Upgrades and Expansion	This project will install additional DMS along ODOT roadways.	Short	ODOT
ODOT Work Zone Safety Improvements	Improvements to work zones to reduce collisions. Ability to alert drivers of a construction zone, roadway hazard, or speed change.	Short	ODOT
OTIC ITS Cameras	OTIC will install ITS cameras to monitor mainline traffic. Cameras will be installed at 8 maintenance building locations, 14 service plaza locations and toll plazas.	Short	OTIC
OTIC Weigh-in-Motion Scales	This project will Install fixed weigh-in-motion (WIM) stations at selected mainline locations along the Ohio Turnpike to measure the weight of passing commercial vehicles in real-time and alert law enforcement of violations. This project will also include procurement of portable WIM scales.	Short	OTIC

Project	Project Description	Project Timeframe	Lead Agency
Connected Vehicle	<p>Deployment of Connected Vehicle (CV) infrastructure, including roadside equipment and controller modifications, to implement vehicle-to-infrastructure (V2I) communications in the 2021-2026 timeframe (as vehicles are equipped). Connected Vehicle is a suite of technologies and applications that use wireless communications to provide connectivity that can deliver transformational safety, mobility, and environmental improvements in surface transportation. Applications provide connectivity with and among vehicles, between vehicles and the roadway infrastructure, and among vehicles, infrastructure, and wireless devices (consumer electronics, such as smartphones and tablets) that are carried by drivers, pedestrians, and bicyclists. This project will utilize the Connected Vehicle and Automated Vehicle (CV/AV) Framework developed by DriveOhio as a guide for deployment.</p>	Short	ODOT, OTIC, Cities and Counties
YSU Research Program: Real-Time Stress Monitoring of Highway Bridges	<p>This collaborative research aims to develop a real-time stress monitoring system for highway bridges with a secured wireless sensor network. The program monitors the stress of highway bridges in Mahoning County with a light-weight and reliable wireless sensor network by applying state of the art technologies in wireless networks, sensor technologies, peer-peer communications, embedded systems, and power managements. The near term goal is to collect wireless sensor data under different traffic patterns from local highway bridges. The long term goal is to build a non-destructive structural health monitoring system and derive a structural health index to predict the remaining life span of a highway bridge in order to save human lives, avoid costly failure, provide timely restoration, prevent unnecessary reconstructions, and minimize disruptions of traffic.</p>	Short	Youngstown State University

Project	Project Description	Project Timeframe	Lead Agency
Medium Term Projects			
City of Warren Smart Work Zone System	This project will procure smart work zone technology for use in work zone management for future construction projects. The purpose of the technology is to optimize safety and mobility in and around work zones, and provide real time data (speeds, volumes, delay/travel times, etc.) that could be viewed by traffic operations and maintenance staff. Real time data can be shared with the public through DMS, a web interface and social media.	Medium	City of Warren
City of Youngstown Multimodal Vehicle Detection System	This project represents installation of a multimodal vehicle detection system at key intersections to improve safety and reduce collisions. System is able to detect vehicles as well as bicycles, scooters, and pedestrians that enter the range of detection. The system provides safer traffic signal operations and help reduce the potential for collisions. The system could use technology such as video, radar, lidar, thermal, or other forms of detection.	Medium	City of Youngstown
City of Youngstown Smart Work Zone System	This project will procure smart work zone technology for use in work zone management for future construction projects. The purpose of the technology is to optimize safety and mobility in and around work zones, and provide real time data (speeds, volumes, delay/travel times, etc.) that could be viewed by traffic operations and maintenance staff. Real time data can be shared with the public through DMS, a web interface and social media.	Medium	City of Youngstown
Lordstown Smart Logistics Hub	The Smart Logistics Hub embraces a three-pronged approach to smart logistics: (1) vehicle electrification, (2) CV/AV-ready infrastructure, and (3) future-focused freight transfer yards to maximize the efficiency, reliability, and safety of freight mobility. Potential ITS infrastructure may include: solar powered EV charging stations, inductive in-road electric charging, automated electric truck trailer transfers, and broadband fiber optic communications. The CV/AV-ready infrastructure portion of this project is part of the DriveOhio CV/AV initiatives.	Medium	Village of Lordstown

Project	Project Description	Project Timeframe	Lead Agency
Mahoning County Smart Work Zone System	This project will procure smart work zone technology for use in work zone management for future construction projects. The purpose of the technology is to optimize safety and mobility in and around work zones, and provide real time data (speeds, volumes, delay/travel times, etc.) that could be viewed by traffic operations and maintenance staff. Real time data can be shared with the public through DMS, a web interface and social media.	Medium	Mahoning County
Mahoning County Weigh-in-Motion Scales	This project will Install fixed weigh-in-motion (WIM) stations at key points along the Mahoning County freight network to measure the weight of passing commercial vehicles in real-time and alert law enforcement of violations. This project could also include procurement of portable WIM scales.	Medium	Mahoning County
Trumbull County Smart Work Zone System	This project will procure smart work zone technology for use in work zone management for future construction projects. The purpose of the technology is to optimize safety and mobility in and around work zones, and provide real time data (speeds, volumes, delay/travel times, etc.) that could be viewed by traffic operations and maintenance staff. Real time data can be shared with the public through DMS, a web interface and social media.	Medium	Trumbull County
WRTA Bus Traffic Signal Priority	Study key transit corridors for applicability of bus traffic signal priority to improve transit travel time. Implement transit signal priority on traffic signals on identified corridors.	Medium	WRTA
WRTA Kiosks at Transfer Points	WRTA to establish kiosk at key locations to provide bus route information and trip planning.	Medium	WRTA
WRTA Real-Time Bus Arrival Signs	This project will install signs/displays at key bus stops and transfer points to provide bus arrival time in real time.	Medium	WRTA
ODOT Maintenance Vehicle Upgrade	Automatic Vehicle Location for maintenance vehicles.	Medium	ODOT
ODOT Service Patrols	Purchase and operate one freeway service patrol vehicle.	Medium	ODOT
YSU Research Program: Work Zones	Establish a research program, in conjunction with ODOT, to test new implementation concepts such as crash mitigation or work zone operations systems.	Medium	ODOT
Long Term Projects			
Municipal Signal Pre-Emption	Pre-emption signal system for emergency vehicles.	Long	Municipalities

Project	Project Description	Project Timeframe	Lead Agency
Trumbull County Traffic Signal Upgrade	This project will modernize the county's existing, traffic signals through replacements or upgrades. This includes replacing or upgrading traffic signals, controllers, and other equipment. Traffic signal controllers will be upgraded to support advanced features, including adaptive traffic control system, high-resolution traffic data collection, transit signal priority, emergency vehicle preemption, and/or connected vehicle applications.	Long	Trumbull County
Mahoning / Trumbull Counties Commercial Vehicle Operations	System collecting data carried in trucks traveling on specific routes.	Long	Mahoning / Trumbull Counties
WRTA Passenger Management System	System that provides fare reconciliation between peer agencies using a common travel card.	Long	WRTA
ODOT RWIS Station Expansion	This project will install additional Road Weather Information System (RWIS) stations at strategic locations along ODOT roadways within the region.	Long	ODOT
ODOT Install Snow and Ice Detection Management and Advanced Snow Plow Systems	Road weather information systems integrated with advanced technology snow plows. These systems provide early warning of icing and snow, and meter the amount of chemical and/or sand applied based on surface conditions, including amount of chemicals already applied.	Long	ODOT
ODOT Highway-Rail Intersection Advanced Safety Systems	Install advanced Highway-Rail Safety Systems at key crossings. A study must be conducted to identify the crossings and the preferred system.	Long	ODOT
OTIC Queue Warning System	This project will install queue detection and warning systems at locations where queues may be formed, such as on approaches to toll plazas, exist ramps and bottlenecks.	Long	OTIC
OTIC Traffic Detection System	This project will install technology at strategic locations along Turnpike to collect traffic counts, vehicle classifications and travel time data.	Long	OTIC

C. USER REFERENCE GUIDE

1. GLOSSARY OF TERMS

Adaptive Traffic Signal System

A system that automatically adjusts traffic signal green times to improve the flow of vehicles as conditions change. The system monitors current traffic conditions, demand and capacity.

Architecture Flow

Architecture Flows (also referred to as “information flows”) refer to information that moves between the components of the physical architecture view of ARC-IT. Architecture flows are the primary tool that is used to define the Regional ITS Architecture interfaces. These architecture flows define what types of information is transferred and how that transfer should occur. For example, one architecture flow would be a dispatcher communicating information to an emergency vehicle responding to an incident.

Architecture Interconnect

Interconnects are communications paths that carry information between components of the physical architecture view of ARC-IT. Several different types of interconnects are defined in ARC-IT to reflect the range of interface requirements in ITS. Some common examples are vehicle to vehicle, point to point, and roadside to vehicle links.

Architecture Reference for Cooperative and Intelligent Transportation (ARC-IT)

ARC-IT is a reference architecture that reflects the contributions of a broad cross-section of the ITS community (transportation practitioners, systems engineers, system developers, technology specialists, consultants, etc.). It provides common basis for planners and engineers with differing concerns to conceive, design and implement systems using a common language as a basis for delivering ITS, but does not mandate any particular implementation.

Arterial (Non-Freeway) Traffic Management

Systems that monitor traffic conditions on roads other than freeways (ex. arterial streets and rural roads). The data collected is used to adjust traffic signal timing in order to improve traffic flow. The information is also used for incident management purposes and is distributed to the public in a variety of ways.

Automated Vehicle (AV)

A vehicle in which at least some aspects of a safety-critical control function (e.g., steering, throttle, or braking) occur without direct driver input. Vehicles that provide safety warnings to drivers but do not perform a control function are, in this context, not considered automated.

Automated Vehicle Maintenance

This technology performs vehicle maintenance scheduling and manages both routine and corrective maintenance activities on agency fleet and construction equipment. It includes on-board sensors capable of automatically performing diagnostics and using it to schedule and manage vehicle maintenance.

Automatic Vehicle Location (AVL)

AVL systems track the approximate location of vehicles moving within a transportation network. The most common applications of AVL technology are for dispatching emergency vehicles, tracking transit vehicles and providing passengers with arrival time estimations through information displays.

Closed-Loop System

A system in which a computer controls a process using information received from within the process itself (e.g., a closed loop coordinated traffic signal system uses data collected by traffic detectors and then uses this information to modify the traffic signal timing plans.)

Computer-Aided Dispatch (CAD)

"Intelligent" interactive mapping and data entry systems that assist in the process of dispatching, monitoring, and managing emergency services. Emergency-dispatching hubs use computers to store, use, and report on information such as incident histories, manpower activities, and other tasks in ways that are logical and simplify the dispatchers' tasks.

Commercial Vehicle Operations (CVO)

Automated and semi-automated systems that support administrative functions for processing many of the functions required of commercial vehicle operators. This includes acquiring credentials, paying taxes, complying with enforcement and safety regulations as well as oversize/overweight permits.

Connected Vehicle (CV)

A vehicle (car, truck, bus, etc.) that is equipped with a wireless communication device. A CV uses any of the available wireless communication technologies to communicate with other cars on the road (vehicle-to-vehicle), roadside infrastructure (vehicle-to-infrastructure), and other travelers and the cloud.

Dedicated Short Range Communications (DSRC)

A wireless communications channel used for close-proximity communications between vehicles and the roadway devices. It enables communications to occur between devices that are very near each other, usually within just a few feet. Examples include automated toll collection, transit vehicle electronic fare payments and equipment maintenance reporting. These systems can also deliver information to drivers and provide electronic transactions for automated vehicle operations.

Dynamic Message Sign (DMS)

Electronic signs that display traffic conditions, alerts or other useful information to motorists or pedestrians. The term is used interchangeably with previous terminology such as variable message signs (VMS) and changeable message signs (CMS).

Element

This is the basic building block of Regional and Project ITS Architectures. It is the name used by stakeholders to describe a system or piece of a system.

Emergency Vehicle Preemption (EVP)

This technology allows emergency vehicles (police, fire trucks, ambulances, etc.) to get priority treatment as they approach traffic signals. These systems can sense the location of the emergency vehicles and adjust the green times so they arrive at the incident sites faster and safer.

Environmental Sensor Stations

Technology that monitors, weather, roadway surface, vehicle emissions, and air/water quality conditions. The primary users of the information from these devices are roadway maintenance, driver information and traffic operations.

Fixed-Point to Fixed-Point Communications

A communication link serving stationary devices. It may operate using a variety of public or private communication networks and technologies. Examples include twisted pair, coaxial cable, fiber optic, microwave relay networks, and spread spectrum radio.

Freeway Management Systems

Freeway Management Systems provide real-time control, guidance, warning, and management of traffic in order to improve the flow of people and goods safely and efficiently.

Functional Object

Functional objects are the building blocks of the physical objects of the physical view. Functional objects group similar processes of a particular physical object together into an "implementable" package. The grouping also takes into account the need to accommodate various levels of functionality. Since functional objects are both the most detailed components of the physical view and tied to specific service packages, they provide the common link between the interface-oriented architecture definition and the deployment-oriented service packages.

Incident Detection

Incident Detection provides the capability for traffic managers to detect and verify that incidents have occurred. This includes analyzing data from traffic surveillance equipment, monitoring alerts from external reporting systems, collecting special event information, and responding to reports from their agency personnel in the field.

Incident/Emergency Management

Incident/Emergency Management enables communities to quickly identify any conditions that interrupt normal traffic flow such as crashes, vehicle breakdowns and debris in the roadway. The system also supports agency coordination to minimize clean-up and medical response time.

Intelligent Transportation Systems (ITS)

ITS applies state-of-the-art and emerging technologies to provide more efficient and effective solutions to current multimodal transportation problems. Some examples of ITS are dynamic message signs, closed-circuit television monitoring systems, and traffic signal systems.

ITS Architecture

A common framework for planning, defining, and integrating intelligent transportation systems. An architecture functionally defines what the pieces of the system are and the information that is exchanged between those pieces. Architecture is defined functionally and does not prescribe particular technologies. This allows the architecture to remain effective over time as technologies evolve. It defines "what must be done," not "how it will be done."

Maintenance and Construction Operations (MCO)

These are functions that support monitoring, operating, maintaining, improving and managing the physical condition of roadways, roadside equipment, and required resources.

Mobile Data Terminal (MDT) or Mobile Data Computer (MDC)

Mobile Data Terminals (MDTs) are computerized devices used in emergency, transit, patrol, maintenance, and other vehicles to communicate with a central dispatch. They feature a screen on which to view

information and a keyboard or keypad for entering information, and may be connected to various peripheral devices, such as an AVL System.

On Board Security Monitoring System

On board security system for transit vehicles. This includes surveillance and sensors to monitor the on-board environment, silent alarms that can be activated by transit user or operator, and a remote vehicle disable function. The surveillance equipment includes video (e.g. CCTV cameras), audio systems and/or event recorder systems.

Ops Concept or Operational Concept

An Operational Concept describes the roles and responsibilities of stakeholders in providing the ITS services included in the ITS Architecture. For example, one of the roles and responsibilities of the LFUCG Traffic Engineering Division is to operate and maintain the traffic signal system.

Physical Object

Physical objects are systems or device that provide ITS functionality that makes up the ITS and the surrounding environment. They are defined in terms of the services they support, the processing they include, and their interfaces with other physical objects. They are grouped into six classes: Centers, Field, ITS, Support, Travelers, and Vehicles. Example physical objects are the Traffic Management Center, the Vehicle Onboard Equipment, and the ITS Roadway Equipment. These correspond to the physical world: respectively traffic operations centers, equipped connected automobiles, and roadside signal controllers. Due to this close correspondence between the physical world and the physical objects, the interfaces between them are prime candidates for standardization.

Public Transportation (PT)

A variety of technology applications that make public transportation more efficient and convenient. Some examples include automated fare payment systems, enunciators to inform people inside and outside the transit vehicles, smart phone APP's to track bus arrival times, and many other applications.

RAD-IT Software

The Regional Architecture Development for Intelligent Transportation (RAD-IT) is an automated software tool used to build and maintain an ITS Architecture. It provides a means to input and manage system inventory, service packages, architecture flows and interconnects with regard to a Regional ITS Architecture and/or multiple Project ITS Architectures.

Regional ITS Architecture

A local version of the ITS National Architecture that is tailored for a specific region. It can be used to produce project architecture reports for specific federally funded projects.

Road Weather Information System (RWIS)

A system consisting of roadside meteorological components strategically located to provide information about weather issues affecting transportation. The principal components of RWIS include pavement sensors, atmospheric sensors, remote processing units (RPU), and central processing units (CPU).

Security Sensors and Surveillance Equipment

This technology includes cameras and sensors to monitor transportation infrastructure (e.g., bridges, tunnels and management centers) to detect potential threats. Such equipment includes acoustic,

environmental threat (nuclear, explosive, chemical), motion and object sensors, and video and audio surveillance devices.

Service Package

Service packages are a combination of ITS architecture components tailored to provide a specific ITS service. For example, the Traffic Incident Management System Service Package combines incident detection systems, roadside surveillance devices, and coordination of traffic management centers to fulfill a number of useful needs related to the rapid clearing of incidents.

Standards

Documented technical specifications sponsored by a Standards Development Organization (SDO) to be used consistently as rules, guidelines, or definitions of characteristics for data transactions.

Subsystem

The principle elements of the physical architecture view of ARC-IT. Subsystems are individual pieces of the Intelligent Transportation System defined by ARC-IT. Subsystems are grouped into five classes: Center, Field, Vehicle, Support, and Personal.

Terminator

Terminators define the boundary of an architecture. The ARC-IT terminators represent the people, systems, and general environment that connect to Intelligent Transportation Systems.

Traffic Management (TM)

A broad category of systems that collect and process information from sensors and CCTV cameras along major roadways. Once processed, the information is then used to manage traffic control devices such as ramp meters, traffic signals and other control devices. These systems are also the source of much of the data used to inform motorists through the Traveler Information systems listed below.

Transit Signal Priority

Transit signal priority refers to systems that usher transit vehicles through traffic-signal controlled intersections. Transit signal priority modifies the normal signal operation to better accommodate transit vehicles. Transit Signal Priority is similar to Emergency Vehicle Pre-emption, but is less invasive to the signal operation.

Traveler Information (TI)

A system, which distributes information to the traveling public over a variety of methods such as dynamic message sign, kiosks, Internet, cable television, smartphones, etc.

Wi-Fi

Wi-Fi is a short-hand generic term referring to the wireless interface of mobile computing devices, such as laptops in local area networks (LANs) and Internet access. Standards are in development that will allow Wi-Fi to be used by cars on highways in support of an Intelligent Transportation System to increase safety, gather statistics, and enable mobile commerce.

2. HOW TO NAVIGATE THE WEBSITE

The purpose of the Eastgate Regional ITS Architecture website is to organize the details of the architecture into a form that is more readily accessible to stakeholders. It provides a method for stakeholders to access the architecture information in order to encourage use of the architecture in both transportation planning and project implementation. The Eastgate Regional ITS Architecture website can be accessed via the Eastgate website at www.eastgatecog.org.

The menu bar at the left of the Architecture website provides access to different pages of the architecture. The pages to which each of these buttons lead are described below.

Home: This button takes the user to the homepage for the Eastgate Regional ITS Architecture. The homepage describes the purpose of the architecture.

Scope: This page provides the geographic scope and service scope of the architecture. It also provides the planning time frame for the architecture.

Stakeholders: This page presents the full list of regional stakeholders, along with descriptions for each.

Inventory: This page presents the inventory of ITS elements along with a brief description of each. The inventory of ITS elements is arranged in an alphabetic order. The list of inventory can also be viewed by entity (subsystems and terminators as defined by ARC-IT) or by stakeholder.

Inventory by Physical Objects: This page presents the inventory of ITS elements arranged by physical objects (subsystems and terminators). This allows all elements with related functions to be viewed simultaneously. Clicking on an element name opens a detail page that provides more information about the element, including a listing of all interfacing elements.

Inventory by Stakeholder: This page presents the inventory of ITS elements arranged by stakeholder. This allows all the elements owned by a single stakeholder to be viewed simultaneously. Clicking on an element name leads to a detail page that provides more information about the element, including a listing of all interfacing elements.

Services: This page presents a list of relevant service packages for the region and their deployment status. Clicking on the service package name links to the definition of the service package, its deployment status in the region, and a list of ITS elements associated with the service package.

Roles and Responsibilities: This page presents a table of relevant ITS service areas for the region. Clicking on a service area links to a detailed page with a list of stakeholders providing the service and their roles and responsibilities in the operations of the relevant ITS systems in the region.

Functions: The page presents a list of ITS functional areas for the region. Clicking on a functional area leads to a detailed page that provides a description of the functional area, a list of regional ITS elements supporting the functions, and a list of functional requirements.

Interfaces: This page presents a table that identifies interfaces among ITS elements for the region. Clicking on an element in the “Element” column leads to a context diagram that shows how the element interfaces with other elements in the region. Clicking on an element in the “Interfacing Element” column brings up

a detailed page that shows an interface diagram between the two elements, along with the definitions of the architecture/information flows.

Communications: This page provides a list of communications standards that are applicable to the region. Clicking on the title of a communications solution opens a page that identifies the standard(s) can be applied to facilitate communications and electronic information exchanges in the region.

Agreements: This page presents a list of agreements that support ITS in the region.

Projects: This page presents a list of potential ITS projects for the region, along with recommended implementation time frame and brief project descriptions. Clicking on a project title opens a detailed page that provides additional information on the project.

3. USES FOR THE ARCHITECTURE

3.1 Project Planning

Eastgate will be responsible for housing and maintaining the ITS Architecture. Being responsible for the architecture requires Eastgate to be able to deliver a subset of the regional architecture that relates to specific projects. In other words, they must be able to produce a project architecture when a local agency is pursuing an ITS project. Typically, a Project Architecture can be created as an extract from the Regional Architecture if the elements were included in the Regional Architecture. The flow diagram in Figure 8 provides guidance on that process.

In order to produce a project architecture, the first step is to identify the type of service package(s) (e.g. transit, traveler information, emergency management, etc.) that are related to the project. Depending on the scope of the project, multiple types of service packages could be relevant and they should all be identified. For example, for a project involving the installation of dynamic message signs, the relevant service package types would be traveler information and emergency management. After service package types are identified, the specific service package(s) that describe the project must be identified. In continuing the example, the specific service packages that relate to dynamic message sign installation would be TM06 Traffic Information Dissemination, PS10 Wide-Area Alert, and MC06 Work Zone Management.

Once specific service packages have been identified, the service package diagrams must be reviewed to make sure they are correct and not duplicating functionality with another service package. For each project, the following items should be considered and inputted into RAD-IT:

- Make sure all specific service packages that relate to the project are identified (i.e. TM06, PS10, MC06, etc.);
- A specific service package may be relevant to multiple agencies. In this case, create multiple instances of that service package if they have not already existed (i.e. a TM06 for City of Youngstown and a TM06 for Mahoning County, etc.);
- Select the appropriate inventory items that are related to each specific service package;
- Select the appropriate stakeholder that owns the inventory item; and
- Check whether the data flow is existing or planned (i.e. future).

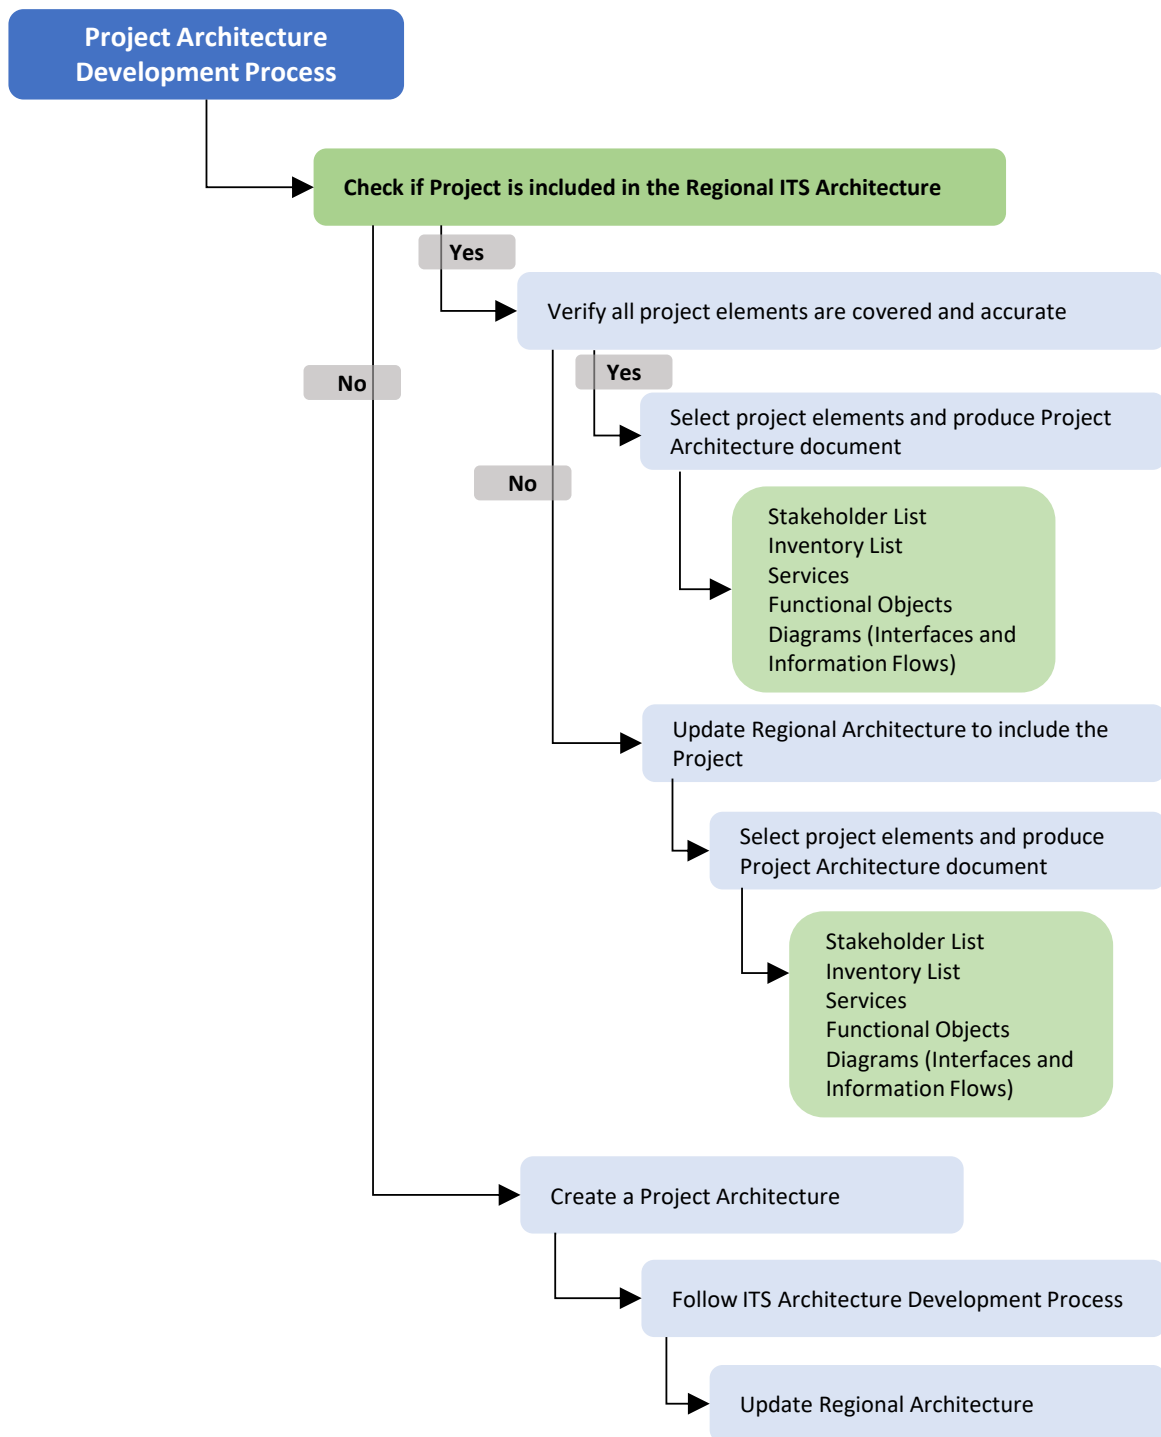

Figure 8. Project Architecture Development Process

Following review of the service package diagrams, the updated diagrams should be passed along to the agencies who are implementing the project to ensure all stakeholders are involved and they have the proper information to determine if it will impact other projects.

3.2 Project Programming

An up-to-date regional ITS architecture is important because projects must be aligned with the area's regional ITS architecture to receive federal funds. This section discusses how stakeholders can determine if a project is consistent with the architecture.

In order to use the Eastgate Regional ITS Architecture to support project development, the agency must identify how the project contributes to or aligns with a portion of the architecture. This is a key step when using the architecture because it requires the agency to view the ITS project in the broader context of the entire architecture. Having an agency consider the wider architecture while the project's scope is being defined, enables them to consider the services, functionality, and integration opportunities that are envisioned by the region as a whole. This step is also required to meet the FHWA Architecture Rule/FTA Architecture Policy.

The ITS Architecture should be used as early in the project development lifecycle as possible so that integration opportunities are considered. The architecture should be reviewed before firm project cost estimates are established so there is still opportunity to adjust the scope in order to accommodate the regional functionality and interfaces identified. This opportunity may occur before or after programming/budgeting, depending on how specifically the ITS project is defined in the programming/budget documents.

3.3 Funding for ITS Projects

ITS projects proposed for the Eastgate region would qualify for several categories of federal highway and transit funding. Each of these categories is discussed below with additional information on the location of these sources.

Highway-related ITS initiatives would likely be funded with Surface Transportation Program (STP) funding dedicated to the Eastgate region or Congestion Mitigation and Air Quality (CMAQ) funds. Transit-related ITS initiatives would be funded with 5307 and CMAQ funds. The Eastgate Transportation Improvement Program (TIP) includes "Grouped Projects" that allow these types of initiatives to be added to the TIP (and thus become eligible for federal funding) by Administrative Modification.

Increasingly, ITS elements are included as a component of broader-purposed ODOT sponsored highway improvement projects. In these cases the ITS elements would be included with the National Highway Performance Program (NHPP), STP, or Highway Safety Improvement Program (HSIP) funded project, and such projects would be added to the TIP by Update, Amendment, or Modification procedures, as appropriate.

ITS projects and components may also be funded with, or included with projects funded with, state or local funds. State and locally funded projects are not required to be listed in the TIP unless they are deemed to be "regionally significant" (refer to the TIP for more discussion). It should also be noted that a re-authorization of federal transportation funding beyond the year 2021 will be required to support many of the grant programs described in this section.

FAST ACT (2015)

The Fixing America's Surface Transportation (FAST) Act was signed into law in December 2015 for fiscal years 2016 through 2020. The previous federal transportation authorization program (Moving Ahead for Progress in the 21st Century (MAP-21)) included provisions to help make the delivery of transportation projects more streamlined and timelier while still meeting the requirements for planning, public outreach

and engagement, and environmental review processes. The FAST Act builds on the efforts of MAP-21 and FHWA's *Every Day Counts* program to continue the acceleration of the delivery of complex but vital transportation projects.

The FAST Act authorizes a significant amount of funding for programs related to research, development, technology, and education. It also builds on MAP-21's transformation of the national transportation program to a performance and outcome-based program. The emphasis on performance management is intended to provide a means to more efficient investment of Federal transportation funds by focusing on national transportation goals, increasing the accountability and transparency of the Federal highway programs, and improving transportation investment decision making through performance-based planning and programming as DOTs incorporate performance goals, measures, and targets into the process of identifying needed transportation improvements and project selection. States will invest resources in projects to achieve individual targets that collectively will make progress toward national goals.

Federal and State Transportation Programs

A combination of federal and state funds is a likely scenario to pay for the implementation and operation of projects. Federal transportation authorization bills, including the FAST Act, continued or established a number of programs which are applicable to the deployment or operation of ITS technologies. Programs such as NHS and STP can be used to support ITS solutions. In addition to those broader programs, there are several specific programs with potential to fund ITS projects:

- **Intelligent Transportation Systems (ITS) Program** – The ITS Program provides \$100 million annually (FY2016-2020) for the research, development, and operational testing of ITS aimed at solving congestion and safety problems, improving operating efficiencies in transit and commercial vehicles, and reducing the environmental impact of growing travel demand (80% federal share).
- **Advanced Transportation and Congestion Management Technologies Deployment Program (ATCMTD)** – This program provides competitive grants for the development of model deployment sites for large scale installation and operation of advanced transportation technologies to improve safety, efficiency, system performance, and infrastructure return on investment (50% federal share).
- **Congestion Mitigation and Air Quality (CMAQ)** – The FAST Act continues the CMAQ program from MAP-21. The program funds projects that help reduce emissions and traffic congestion in areas designated as nonattainment or maintenance areas for carbon monoxide, ozone or particulate matter. Eligible projects include projects to improve mobility such as through real-time traffic, transit and multimodal traveler information, or otherwise reduce demand for roads through means such as telecommuting, ridesharing, carsharing, and pricing. The FAST Act also specifically makes eligible the installation of vehicle-to-infrastructure communications equipment. The FAST Act also continues eligibility for electric vehicle and natural gas vehicle infrastructure and adds priority for infrastructure located on the corridors designated under 23 U.S.C. 151.
- **Surface Transportation Block Grant Program (STBG)** – Program provides flexible funding that may be used by States and localities for projects to preserve and improve the conditions and performance on any Federal-aid highway, bridge and tunnel projects on any public road, pedestrian and bicycle infrastructure, and transit capital projects, including intercity bus terminals.

- **National Highway Performance Program (NHPP)** - NHPP funds may be obligated for a project on an eligible facility that supports progress toward the achievement of national performance goals for improving infrastructure condition, safety, congestion reduction, system reliability, or freight movement on the NHS. Eligible projects include highway safety improvements on the NHS, which may also include truck parking per 23 U.S.C. 148.
- **National Highway Freight Program (NHFP)** – The NHFP provides formula funds to States to improve the condition and performance of the National Highway Freight Network under 23 U.S.C. 167(i)(5)(C). Eligible activities include truck parking facilities and real-time traffic, truck parking, roadway condition, and multimodal transportation information systems. The NHFP funds are eligible for use on the National Highway Freight Network, as appropriate.
- **Highway Research and Development (HRD) program** – The HRD Program funds strategic investment in research activities that address current and emerging highway transportation needs, including activities to improve highway safety; activities to reduce congestion, improve highway operations, and enhance freight productivity; and exploratory advanced research (80% federal share).
- **Technology and Innovation Deployment Program (TIDP)** – The TIDP is focused on funding efforts to accelerate the implementation and delivery of new innovations and technologies that result from highway research and development to benefit all aspects of highway transportation (80% federal share).
- **FASTLANE (Fostering Advancements in Shipping and Transportation for the Long-term Achievement of National Efficiencies) grants** – The FAST Act establishes a discretionary competitive grant program of \$4.5 billion over five years to provide financial assistance to nationally and regionally significant highway, rail, port, and intermodal freight and highway projects (maximum 60% federal share through this program).
- **Nationally Significant Freight and Highway Projects (NSFHP) program** – The NSFHP provides competitive grants, known as Infrastructure for Rebuilding America (INFRA) grants, or credit assistance to nationally and regionally significant freight and highway projects (maximum 60% federal share through this program).
- **Highway Safety Improvement Program (HSIP)** – The HSIP promotes reduced traffic fatalities and serious injuries on urban and rural public roads including work zones.
- **Railway/Highway Crossings** – The FAST Act authorized \$1.3 billion over five years for this program, which promotes reductions in the number and severity of injuries at public highway-railroad crossings (90% federal share).
- **Training and Education Program** – Funding for training, education, and workforce development activities that promote and support national transportation programs and activities.

Federal Grants

The principal purpose of an award of financial assistance is to transfer a thing of value from a federal agency to a recipient to carry out a public purpose of support or stimulation authorized by a law of the United States. A grant differs from a contract, which is used to acquire property or services for the Federal government's direct benefit or use. Federal grant information is available electronically at www.grants.gov.

- **BUILD Grant Program** -- The Better Utilizing Investments to Leverage Development, or BUILD Transportation Discretionary Grant program, provides a unique opportunity for the DOT to invest in road, rail, transit and port projects that promise to achieve national objectives. Previously known as Transportation Investment Generating Economic Recovery, or TIGER Discretionary

Grants, the BUILD program enables DOTs to examine projects on their merits to help ensure that taxpayers are getting the highest value for every dollar invested.

The eligibility requirements of BUILD allow project sponsors at the State and local levels to obtain funding for multi-modal, multi-jurisdictional projects that are more difficult to support through traditional DOT programs. BUILD can provide capital funding directly to any public entity, including municipalities, counties, port authorities, tribal governments, MPOs, or others in contrast to traditional Federal programs which provide funding to very specific groups of applicants (mostly State DOTs and transit agencies).

- **Innovative Technology Deployment (ITD) Grant Program** – The Federal Motor Carrier Safety Administration (FMCSA) offers additional funding opportunities through its Innovative Technology Deployment (ITD) Grant program. The program supports the deployment, operation, and maintenance aspects of the ITD program across the US.
- **Motor Carrier Safety Assistance Program (MCSAP) Grants** – The goal of the program is to improve motor carrier, commercial motor vehicle, and driver safety to support a safe and efficient surface transportation system. The program funds are eligible for deployment activities and activities to develop new and innovative advanced technology solutions that support commercial motor vehicle information systems and networks and for the operation and maintenance costs associated with innovative technology.

Public/Private Partnerships (P3)

A public-private partnership (commonly called a P3) is a contractual agreement between a public agency and a private entity that allows for greater private sector participation in the delivery and financing of a project. P3 arrangements provide the public sector with a proven tool to accelerate infrastructure delivery and contain costs. P3s provide a role for the private sector in solving public challenges, provide a variety of contract structures and financing, and are performance-based and outcome-focused. P3 delivery methods commonly fall into the following categories: design-build (DB), operate-maintain (OM), design-build-operate-maintain (DBOM), design-build-finance (DBF), and design-build-finance-operate-maintain (DBFOM). Each method can offer advantages or disadvantages, depending on the specific project and parties involved. Every transportation project is different and may or may not benefit from innovative delivery methods such as P3s.

Transit Funding

Federal transit funding is appropriated annually. Programs include: Urbanized Area Formula Program (5307), Rural Area Formula Program (5311, includes rural, small urban, and intercity bus), Enhanced Mobility of Seniors and Individuals with Disabilities Formula Program (5310), Metropolitan and Statewide Non-metropolitan Transportation Planning Formula Program (5303, 5304, 5305), State of Good Repair Grants (5337), and Bus and Bus Facilities Formula Grants (5339(a)).

The FAST Act continues several important goals established in MAP-21, including safety, state of good repair, and performance. It adds funding eligibility for the deployment of low or no emission vehicles, zero emission vehicles, or associated advanced technology. It continues to fund BRT projects in defined corridors that demonstrate substantial investment in fixed transit facilities including transit stations, ITS technology, traffic signal priority, and off-board fare collection.

Transportation Security Funds

Transportation security funds are another opportunity for funding projects with security applications, such as surveillance cameras or communications devices. Transportation enhancements and ITS projects can address security concerns by detecting threats, maximizing the movement of people, goods, and services, and supporting response activities. Security funds could be available through the Department of Homeland Security, Department of Agriculture, or the Department of Energy, as well as other agencies.

One example of these sources through the Department of Homeland Security is through preparedness grants to improve the nation's readiness in preventing, protecting against, responding to, recovering from and mitigating terrorist attacks, major disasters and other emergencies. ITS technologies can be used for monitoring and surveillance of transportation infrastructure (e.g., bridges, tunnels and management centers) and help to mitigate the impact of an incident if it occurs. CCTV cameras are a common technology used by transportation agencies for this purpose, and thus preparedness grants through the department of homeland security are a potential funding source for this activity.

3.4 Project Design Concerns

When designing a project, functionality and ITS standards provide guidance and criteria to identify how the project will relate to the region's overall operations. As projects grow in size, the functions and standards become complex and sometimes require agreements between agencies. It is beneficial to identify the agencies involved and the type(s) of agreement(s) needed early on in the project design.

How ITS components are shown in the architecture

The ARC-IT uses service packages to depict the current and future functions of ITS systems. Entities that represent sources of information are called "subsystems", which are grouped into four classes: centers, fields, vehicles, and travelers as shown in Table 6 on the next page. Table 6 provides descriptions from ARC-IT for each subsystem and identifies examples of those subsystems in the region.

Table 6. Subsystem Definitions

Subsystem	Definition	Examples in Eastgate Region
Center	Provides management, administrative, and support functions for the transportation system. The center subsystems each communicate with other centers to enable coordination between modes and across jurisdictions.	Traffic Management Centers Emergency Operations Centers 911 Centers
Field	Intelligent infrastructure distributed along the transportation network which perform surveillance, information gathering, and information dissemination and whose operation is governed by the center subsystem.	Traffic Signals CCTV Cameras Dynamic Message Signs Vehicle Detection
Vehicle	Covers ITS related elements on vehicle platforms such as automatic vehicle location equipment and operations capabilities for portable field equipment.	Maintenance and Construction Vehicles Public Safety Vehicles Incident Response Vehicles
Traveler	Equipment used by travelers to access ITS services prior to a trip, including information service providers.	Transit Bus Arrival/Departure Signs Smartphones Personal Computers

How to find general functional requirements related to a proposed project

Functional requirements explain how an inventory item provides the services described in their equipment packages. Equipment packages group inventory items together based on what overall function they serve and are listed in deployment-sized pieces (for example: emergency dispatch, roadway basic surveillance, traffic data collection, and transit center fixed-route operations).

The functional requirements can be found on the ARC-IT website (<https://local.iteris.com/arc-it/index.html>). The following process should be followed to access requirements for specific inventory items:

- Under the “Architecture” drop-down arrow in the top left corner of the Home Page of the ARC-IT website, select “Physical” that appears under “Views”
- Then click on the “Physical Objects” hyperlink that appears in the text on the Physical architecture web page
- Click on the “Subsystems” tab that will present all of the subsystems in ARC-IT, and then select the subsystem for which you are seeking functional requirements
- Click on the “Functionality” tab that will present the functional objects associated with the subsystem
- Click on the desired “Functional Object” to view its description
- Click on the “Requirements” tab, which will present a list of functionalities for each functional object.

How to obtain specific functional requirements from the Eastgate Regional ITS Architecture

The need to obtain specific functional requirements from the Eastgate Regional ITS Architecture related to a specific project can be found on the ITS Architecture website hosted by Eastgate, following the instructions in Part C, Section 2 of this report.

A complete listing of functional requirements for the Eastgate Regional ITS Architecture can be found on the ITS Architecture website.

How to select communication standards that apply to the project

ITS standards define how system components interact within the overall framework of ARC-IT. The use of standards ensures interoperability amongst various functions of an ITS project so that components or technologies from various vendors and at different scales (local, regional, and national) are still compatible. Standards also facilitate innovation in technology development without necessitating replacement of hardware or software systems that are needed to operate the new technology. Other purposes for ITS standards include:

- ITS standards used in a deployment can greatly reduce component development costs;
- ITS standards are open and non-proprietary, helping state and local transportation managers avoid costly single-source procurements and locked-in maintenance relationships with vendors;
- ITS standards support the deployment of interoperable ITS systems, helping agencies link together different types of ITS technologies and making system expansions easier to plan and implement; and
- ITS standards are being developed for many different types of ITS technologies and their use in project deployment is a key aspect of conformity with the FHWA Final Rule 940.

New standards that are developed go through an approval process before they are included in documents as formalized standards. Existing standards are amended and modified as needed based on new standards development or new technology development. Several national and international standards organizations are working toward developing ITS standards for communications, field infrastructure, messages and data dictionaries, and other areas. The organizations participating in ITS standards activities include:

- AASHTO (American Association of State Highway and Transportation Officials)
- ANSI (American National Standards Institute)
- APTA (American Public Transportation Association)
- ASTM (American Society for Testing and Materials)
- IEEE (Institute of Electrical and Electronics Engineers)
- ITE (Institute of Transportation Engineers)
- NEMA (National Electrical Manufacturers Association)
- SAE (Society of Automotive Engineers)

A listing of ITS standards that are pertinent to the Eastgate Regional ITS Architecture is contained in the ITS Architecture website.

Why agreements may be needed to support a proposed project

Institutional agreements can support ITS functionality and project development in the region. Agreements allow agencies to document the roles and responsibilities of the particular service or function that is being agreed to, as well as any obligations each agency has for maintenance, operations, or financial support.

A listing of agreements based on the types of interfaces identified in the Eastgate Regional ITS Architecture is contained in the RAD-IT database and the Architecture website. It is important to note that as ITS services and systems are implemented or expanded in the region, part of the planning and review process for those projects should include a review of potential agreements that would be needed for implementation or operations. These additional agreements are not listed in the ITS Architecture for specific projects because the possibility of coordination/sharing/joint operations is unique and should be evaluated for every project.

4. ARCHITECTURE MAINTENANCE PLAN

The Eastgate Regional ITS Architecture has been created as a consensus view of what ITS systems the stakeholders within the architecture boundary already have in place and what systems they plan to implement in the future. By its nature, the architecture is not a static set of outputs. The Architecture should be modified as plans and priorities change, ITS projects are implemented, and the ITS needs and services evolve in the region. There are many actions that may cause a need to update the architecture, including:

- **Changes in Project Definition.** When actually defined, a project may add, subtract or modify elements, interfaces, or information flows of the ITS Architecture. Because the architecture is meant to describe not only ITS planned, but also the current ITS implementations, it should be updated to correctly reflect the deployed projects.

- **Changes due to Project Addition/Deletion.** Occasionally a project will be added, deleted or modified during the planning process. When this occurs, the aspects of the ITS Architecture associated with the project should be added, deleted or modified.
- **Changes in Project Status.** As projects are deployed, the status of the architecture elements, services and flows that are part of the projects will have to be changed from planned to existing. Elements, services and flows should be considered to exist when they are substantially complete.
- **Changes in Project Priority.** Due to funding constraints, technological changes or other considerations, a project planned may be delayed or accelerated. Such changes should be reflected in the ITS Architecture.
- **Changes in Regional Needs.** Transportation planning is done to address regional transportation needs. Over time these needs change and the corresponding aspects of the ITS Architecture that addresses these needs should be updated.
- **Changes in Participating Stakeholders.** Stakeholder involvement can also change over time. The ITS Architecture should be updated to reflect the participating stakeholder roles in the statewide view of ITS elements, interfaces, and information flows.
- **Changes in Other Architectures.** The ITS Architecture includes not only elements and interfaces within the architecture boundary, but also interfaces to elements in adjacent and other areas. Changes in the Statewide ITS Architecture and ITS Architectures in adjacent areas may necessitate changes in the Eastgate Regional ITS Architecture to maintain consistency. A Regional ITS Architecture may overlap with the Statewide ITS Architecture, and a change in one architecture may necessitate a change in the other.
- **Changes in ARC-IT.** ARC-IT will be expanded and evolved from time to time to include new user services or refine existing services. These changes should be considered as the ITS Architecture is updated. Updates to ARC-IT and RAD-IT will be publicized on the ITS Joint Program Office (JPO) Architecture website: <https://www.its.dot.gov/index.htm>.

4.1 Who Is Responsible for Architecture Maintenance?

Responsibility for maintaining the ITS Architecture will lie with Eastgate. Eastgate should coordinate the maintenance activities and be the point of contact, including collecting, reviewing and evaluating change requests, tracking change requests, requesting additional information from stakeholders, distributing documentation, as well as calling meetings, making meeting arrangements, assembling an agenda, leading the meetings, and approving minutes.

4.2 What Will Be Maintained?

The following should be reviewed and updated at regular intervals:

- Description of the region
- Participating agencies and other stakeholders, including key contact information
- Inventory of existing and planned ITS systems in the region
- Operational concept that identifies the roles and responsibilities of participating agencies and stakeholders in the operation and implementation of the systems
- Agreements for operations and interoperability
- System functional requirements
- Interface requirements and information exchanges with planned and existing systems and subsystems
- Applicable ITS standards supporting regional and national interoperability
- Sequence of projects for implementation

There are several different components that make up the ITS Architecture. Some may require more frequent updates than others, but the entire architecture will need periodic review to ensure that it is consistent with the regional goals. The most current version of the Eastgate Regional ITS Architecture shall be the baseline architecture upon which future revisions are conducted as necessary.

The Eastgate Regional ITS Architecture was created based on ARC-IT Version 9.0 using RAD-IT Software Version 9.0. The Architecture was documented and stored in the following forms:

- Eastgate Regional ITS Architecture Report
- Eastgate Regional ITS Architecture Website
- Electronic RAD-IT database

The RAD-IT database can generate a set of outputs including various reports, tables, diagrams, and the architecture webpages. Such outputs include interconnect and architecture flow diagrams, inventory lists, stakeholder lists, service package lists, functional requirements, and other diagrams and reports. A generic ITS architecture report can also be generated directly from RAD-IT. At a minimum, the architecture should be maintained through updates in the database using the RAD-IT software.

4.3 How Changes Are Identified

Changes to the ITS Architecture may be identified by two channels. One is that stakeholders submit a request, and the second channel is actively soliciting changes from each stakeholder on an annual basis.

Stakeholders can contact Eastgate to propose changes to the ITS Architecture. Eastgate will perform an initial assessment of the proposed change for the impact to the ITS Architecture and/or the affected documentation. If the proposed change has an impact on other stakeholders, Eastgate should contact those stakeholders to confirm their agreement with the proposed modification.

The second channel is for Eastgate to distribute an annual survey to stakeholders to proactively solicit the need for updating the architecture. This survey will contain a few basic questions for stakeholders to answer. A sample survey can be found in Table 7. If additional information is needed, Eastgate will contact the stakeholder(s) to identify the need for updating the architecture.

4.4 How Often Changes Are Made

It is recommended that a comprehensive, formal update of the ITS Architecture Baseline is performed concurrently with the Eastgate Metropolitan Transportation Plan (MTP) updates to ensure the architecture continues to accurately represent the regional goals. It is further recommended that a comprehensive update of the architecture baseline is performed within 6 months prior to or in conjunction with the MTP update.

Between major updates of the architecture, minor or informal modifications may be made at the discretion of Eastgate. Eastgate will solicit changes from stakeholders of needed updates. Eastgate will contact stakeholders, via e-mail, written correspondence, and/or by telephone, and inquire if the stakeholder has any changes to the ITS Architecture. The change requests will be collected and reviewed by Eastgate staff for consideration in the next minor update.

In addition, this Maintenance Plan should also be reviewed and evaluated periodically for required changes to the maintenance process. The actual maintenance process and procedures may differ from

those anticipated during the initial development of this Maintenance Plan. Revising the Maintenance Plan will ensure both an effective architecture maintenance process and a change management process.

Table 7. Sample Architecture Maintenance Survey Questionnaire

Eastgate Regional ITS Architecture Maintenance Survey Questionnaire

1. Did your agency implement (including upgrade) any technology and communications related projects for transportation systems or emergency management in the past 12 months?

☐ Yes ☐ No

If YES, please describe the project(s) and/or provide project name(s) and available documentation source(s).

2. Do you plan to implement any technology or communications related projects in the next 5 years?

☐ Yes ☐ No

If YES, please describe the project(s) and/or provide project name(s) and available documentation source(s).

3. Please provide your contact information:

Name: _____

Agency: _____

Phone: _____

Email: _____

Please submit this form to: XXXXXXXXX, Email: XXXX, Phone: XXXX, Fax: XXXX. Thank you!

4.5 Change Review, Implementation and Release

The general steps in the change management process are described below:

1. Stakeholders identify changes, notify Eastgate of changes, (or complete the annual survey), and submit it to Eastgate. If the initial information is gathered via the annual survey, Eastgate contacts the stakeholder for more information.
2. Eastgate reviews the proposed changes, offers comments, and/or asks for additional information.
3. Eastgate, in coordination with the appropriate stakeholders affected by the proposed changes, evaluates the changes and determine what impact they may have on the Architecture and/or associated documentation.
4. Upon its evaluation, Eastgate makes a decision to accept the change, reject it, or ask for additional information.
5. If the decision is to accept the change, then the appropriate portions of the architecture baseline are updated by Eastgate staff.
6. Once the ITS Architecture has been modified, Eastgate publishes the updated architecture documentation, database and website.
7. Eastgate also notifies all stakeholders of architecture updates and provides information on how to obtain the latest version of the Architecture.
